BASIC STATISTICS OF SWEDEN

THE LAND

Area (1 000 sq.km)	450
Lakes (1 000 sq.km)	39
Arable area (1 000 sq.km)	31
Woodland (1 000 sq.km)	228

Inhabitants in major cities, including suburbs (end of 1971), thousands:	
Stockholm	1 352
Gothenburg	686
Malmo	449

THE PEOPLE

Population (end of 1972)	8 129 000
No. of inhabitants per sq.km	18
Net natural increase (average 1968-1972)	28 980

Net natural increase per 1 000 inhabitants (average 1968-1972)	3.6
Net immigration (average 1968-1972)	19 400

PRODUCTION

Gross Domestic Product in 1972 (Kr. million)	198 648
GDP per head, US $	5 080

Gross fixed capital formation in 1972:	
Per cent of GDP	22.1
Per head, US $	1 120
Employment:	
Total civilian (thousands)	3 862
Per cent of total:	
Agriculture, forestry, fisheries	7.4
Industry	28.2
Other	64.4

THE GOVERNMENT

Per cent of GDP in 1972:	
Public consumption	24
General government current revenue	52
Public gross fixed capital formation	9
Per cent of general government revenue in 1972:	
Public debt, end of 1972	36

Fiscal year:
Central government: 1st July-30th June
Local authorities: calendar year

Composition of Parliament (no. of seats):	
Social democrats	163
Liberals	58
Conservatives	41
Centre	71
Communists	17
	350

Last general election: September 1970
Next general election: September 1973

FOREIGN TRADE

Exports of goods and services as per cent of GDP (average 1968-1972)	24
Main exports in 1972 (per cent of total merchandise exports):	
Forestry products	22
Engineering products (excluding ships)	40
Iron and steel	8
Iron ore	4

Imports of goods and services as per cent of GDP (average 1968-1972)	23
Main imports in 1972 (per cent of total merchandise imports):	
Engineering products (excluding ships, etc.)	33
Raw materials (non-edible) and fuels	15
Metals and metal products	13
Food, beverages and tobacco	10

THE CURRENCY

Monetary unit: Krona

Currency units per US $, central rate:	
— from 20.12.1971	4.8129
— from 14.2.1973	4.5600

NOTE An international comparison of certain basic statistics is given in an annex table.

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The Organisation for Economic Co-operation and Development (OECD) was set up under a Convention signed in Paris on 14th December, 1960, which provides that the OECD shall promote policies designed:

- *to achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;*
- *to contribute to sound economic expansion in Member as well as non-member countries in the process of economic development;*
- *to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.*

The Members of OECD are Australia, Austria, Belgium, Canada, Denmark, Finland, France, the Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States.

The Socialist Federal Republic of Yugoslavia is associated in certain work of the OECD, particularly that of the Economic and Development Review Committee.

INTRODUCTION

Recent years have seen marked departures from past trends. As in most other Member countries the last two to three years have been marked by recessionary tendencies, but the level of activity in Sweden has held up much less well than in earlier post-war recessions. Part I of the present Survey analyses the main factors behind this development as well as the improvements of the current external account and the price/cost performance accompanying the weak trend in activity. Important structural imbalances have appeared in the labour market, partly reflecting changes in the pattern of demand (Part II). Exports and industrial production recovered strongly in the second half of 1972, and the upturn in activity should continue in the present year. But with demand management policy remaining cautious, the rise in real GDP may not significantly exceed the five per cent mark. In these circumstances, and given the structural labour market imbalances that have developed, unemployment may remain higher than usual for some time to come (Part III).

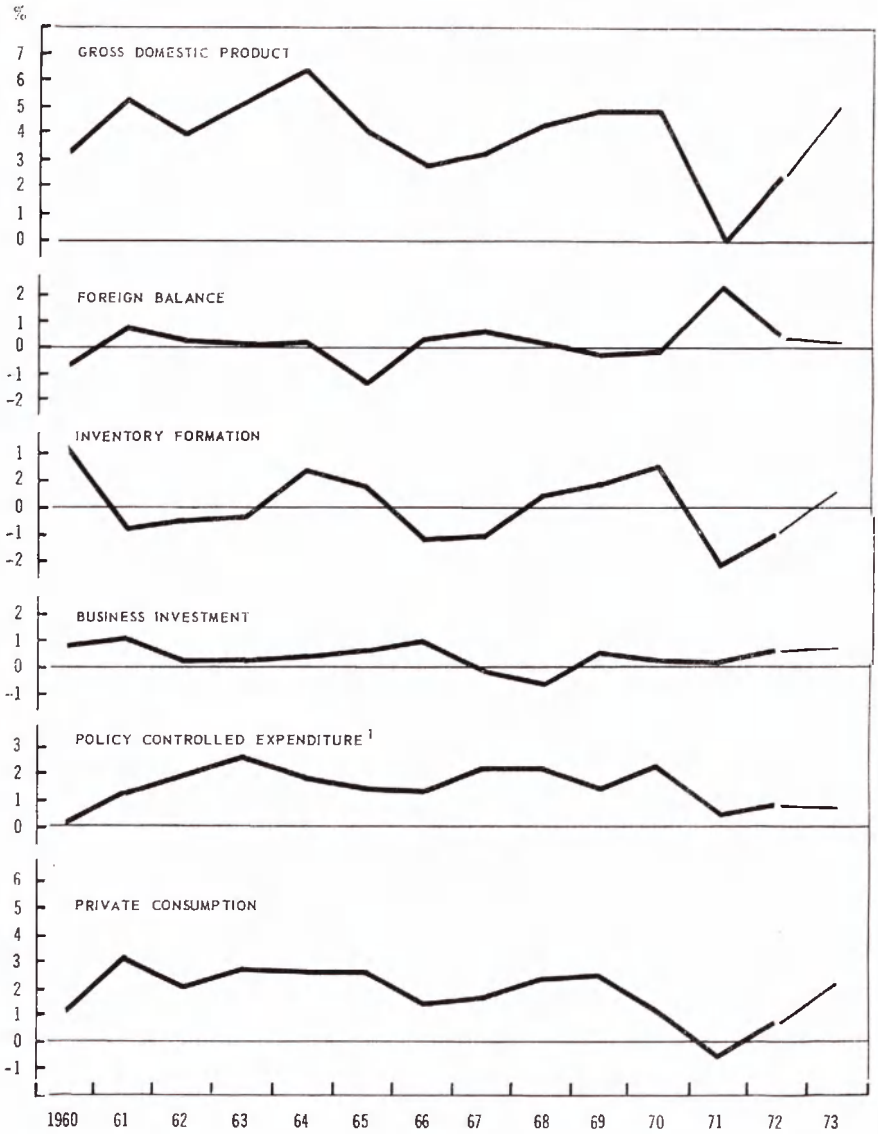
I DEPARTURES FROM PAST TRENDS

Diagram 1, showing the sources of growth in terms of annual changes in major GDP components over the last decade, illustrates the relatively weak trends in activity during the recent recession. Over the two years 1971 and 1972, real GDP rose at an average annual rate of some 1 per cent. Total domestic expenditure was even weaker showing virtually no change in volume over the two years taken together. Analysing the factors behind these developments, it is of some interest to distinguish between exogenous influences, i.e. the deflationary impulses the economy has received, and policy factors, i.e. the extent to which policy has or has not been able to counteract these impulses.

Exogenous influences

Although the distinction between exogenous and policy factors is not clear-cut—most types of demand are influenced by both exogenous and policy factors—it is probably true to say that exports and stockbuilding are largely determined by exogenous influences. Diagram 1 shows that inventory demand was weaker in the last two years than during the two earlier recessions, i.e. 1962-63 and 1966-67, despite the fact that during the recent period policy

Diagram 1 **Sources of Growth**
Change from previous year as per cent of previous year's GDP, volume terms



1 Public consumption, public investment and dwelling construction.
Sources: Swedish National Accounts and Revised National Budget for 1973.

measures were taken to stimulate it[1]. Since the import content in stockbuilding is high, probably about 50 per cent, the deflationary impact on the economy of the marked decline in inventory formation has been attenuated by slower import growth. In these circumstances, it may be appropriate to consider the movement of net exports and stockbuilding combined (see Table 1).

Table 1 Net Exports and Stockbuilding During Three Recessions
Change from previous year, annual rate, per cent of previous year's GDP

	1962-63	1966-67	1971-72
Stockbuilding	–0.5	–1.2	–1.5
Net Exports	+0.2	+0.5	+1.1
Total	–0.3	–0.7	–0.4

Business fixed investment is also a cyclically sensitive demand component. Judging from Diagram 1, it showed a countercyclical movement in 1971-72, unlike its development during the previous cycle. During the recent period, however, very strong policy measures were taken to stimulate business fixed asset formation[2]. This was also the case in the two previous recessions, but although the impact of these measures is difficult to assess, it may well be true that " pure " business fixed investment in the last two years was weaker than in the two earlier episodes.

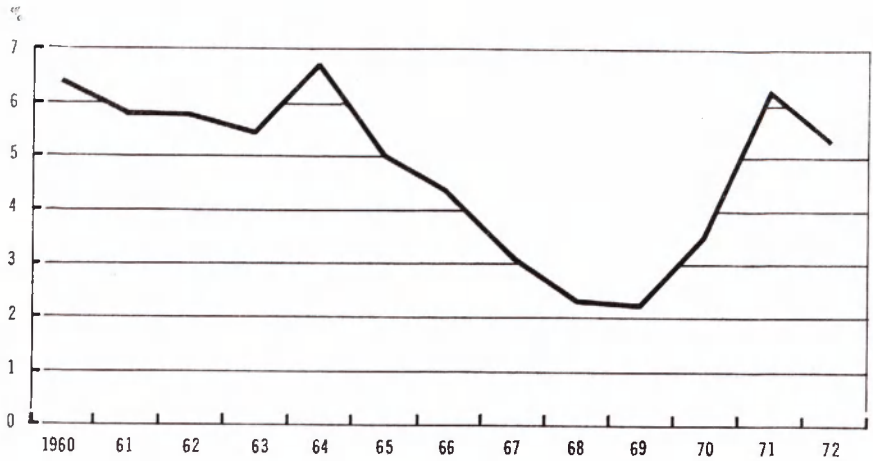
During previous recessions, private consumption typically held up well, partly reflecting the fact that employment was sustained by an active countercyclical policy. In 1971, however, private consumption fell in real terms, in marked contrast to the authorities' expectation of a 3 per cent increase (National Budget, January, 1971). The deviation was largely due to a sharp rise in the savings ratio; households' disposable income and consumer prices rose roughly in line with expectations. Since the change in the savings ratio was probably largely unrelated to economic policy, it may be appropriate to consider this change as an exogenous influence.

According to official national accounts statistics, the personal savings ratio, after having fluctuated narrowly around the 6 per cent level during the first half of the 1960's, fell steadily during the second half of the decade to 2.2 per cent in 1969. It was generally assumed that this movement was partly due to the introduction of the supplementary pension scheme in 1960 which,

1 The timing of recessions has generally not coincided with calendar years and the various demand components do not seem to have followed the same pattern of fluctuations. As far as stockbuilding and exports are concerned the two 2-year periods referred to seem to be those most comparable with 1971-72.

2 Release of investment reserve funds, special depreciation allowances and large subsidies to environmental investment. It is difficult to assess the effect of these measures since enterprises, in their planning, may assume that measures will be taken to stimulate investment, notably, a release of investment reserve funds. It is likely, however, that in the absence of measures investment would have declined in 1972 when cash flows were reduced and capacity utilisation was low.

Diagram 2 **Household Savings Ratio**
Savings as per cent of disposable income



Sources: Swedish National Accounts and Revised National Budget for 1973.

when fully implemented, would provide everybody with a pension large enough to substantially reduce the need for saving for the purpose of maintaining a certain standard of living after retirement.

However, the savings ratio rose again to 3.5 per cent in 1970 and then jumped unexpectedly back to the 6 per cent level (6.2 per cent) in 1971. To some extent this movement may have been influenced by some shift of consumer spending from 1971 to 1970 in response to the increase in indirect taxation at the turn of the year; this, however, would not explain the fact that the savings ratio remained at a high level in 1972. More uncertain employment prospects, and growing demand for one-family houses (for which, in contrast to appartments, a more substantial part of the financing must be arranged by the owner) may have contributed to higher savings, but are hardly sufficient to explain the size of the change in the savings ratio. It may be relevant that in the national accounts statistics, savings are determined as a residual between the estimates of two large flows: disposable income and consumer expenditure; relative small errors of estimation in one of both of these could have a proportionately big impact on the balance between the two. But it may also be relevant to note that the increase in the personal savings ratio in Sweden is not out of line with trends in many other countries in the last few years, movements for which fully satisfactory explanations cannot easily be found.

On the basis of this rather impressionistic analysis, it would seem that the deflationary impulses the economy received in 1971 and 1972 were stronger than during the two previous recessions, and that in particular the sharp and unexpected rise in the personal savings ratio was an important element in the weak domestic demand in the last two years.

Policy influences

In recent years, demand management policy has been more cautious than earlier, apparently influenced by the following considerations:

(*a*) The persistence of current external deficits in the wake of the excessive boom conditions in the mid-1960s was a matter of concern to the authorities. The high priority attached to restoring a structural surplus on goods and services sufficient to cover Sweden's development assistance has influenced demand management policy in subsequent years.

(*b*) There were indications in the mid-1960s that the price/cost competitiveness of Swedish industry had deteriorated. In line with the balance-of-payments target, the achievement of better cost/price stability has been an important aim in recent years.

(*c*) Past experience suggests that exports and domestic demand may recover rapidly underlining the importance of avoiding the maintenance of a sizeable policy stimulus over a prolonged period.

(*d*) The possibility that the sharp rise in the personal savings ratio in 1971 might be reversed in 1972 was an element influencing policy in the latter year.

(*e*) The efforts made to avoid further increases in taxation, given the high level already reached and the public's strong resistance against higher taxes, have led to a more cautious attitude towards increases of expenditure of a more permanent nature.

In Sweden, not only central but also local government expenditure and residential construction have generally, at least until recently, been considered as rather strictly controlled by the authorities. Diagram 3 shows that these demand components moved in a counter-cyclical manner in 1962-63 and 1966-67, but that the size of the stimulus imparted by these demand components was much smaller in the last two years. Residential construction and public investment fell in real terms and the advance in public consumption was slower than earlier. Residential construction declined already in 1970, reflecting a saturation in demand for dwellings at existing prices and other conditions. With weaker demand for dwellings it became more difficult to use residential construction as an instrument of demand management policy. In fact, despite various measures adopted to stimulate housebuilding, dwelling starts in 1972 (98 000) fell short of the authorities' target (100 000). Since 1969 the growth of local authorities' investment has also been much smaller than earlier[1], reflecting not only lower infrastructural investment related to housebuilding, but a generally more cautious investment policy probably influenced by the ceiling imposed on their tax rates. Central government investment rose strongly in 1971-72.

The impression of a prudent demand management policy is confirmed if, in addition to policy-controlled expenditure on goods and services, i.e. the

1 According to the National Institute of Economic Research the year-to-year fluctuations in the growth of local authority investment have to some extent reflected book-keeping operations related to the increase in TVA on 1st January, 1971. The actual development of expenditure between 1970 and 1971 has probably been smoother than suggested by the national accounts statistics.

Diagram 3 **Trends in Publicly Influenced Demand Components**

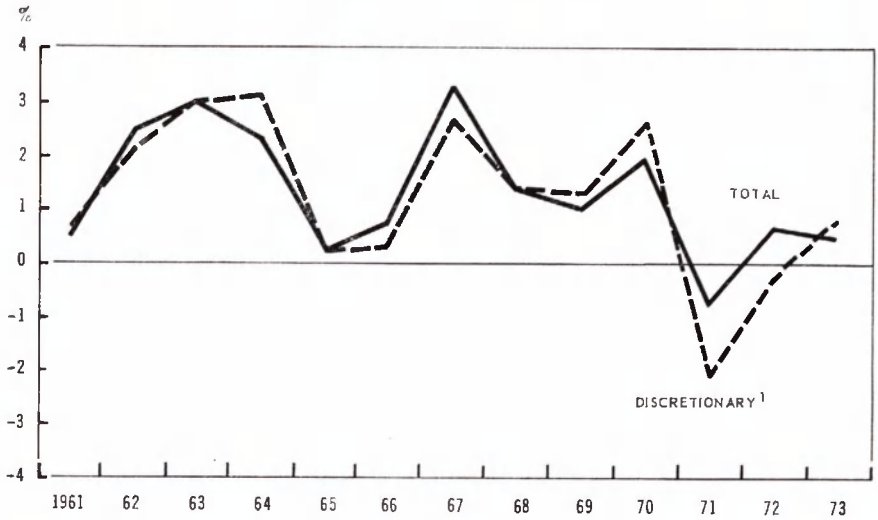
demand components considered above, the analysis is extended to cover taxes as well as the public sector's[1] other expenditures such as transfer payments and subsidies. Diagram 4 and Table 2, in fact, suggest that contrary to the two preceding recessions the demand impact of the public sector's transactions as officially estimated was only moderately expansionary in 1972 and even slightly restrictive in 1971 despite special employment supporting measures and important built-in stabilizers operating notably on the revenue and expenditure side of the Central government budget. The overall " impact " was strongly influenced by the weak trends in housing and local authority investment.

Diagram 4 **Demand Impact of Public Sector and Housebuilding**
Per cent of GDP, volume terms



1 Total excluding the estimated impact of certain automatic fiscal stabilisation effects.

NOTE Official estimates of demand impact based on the assumption that all categories of expenditure on goods and services have approximately the same impact on demand, that all taxes reduce demand to the same extent and that transfers may be considered as negative taxes.

Source: Revised National Budget for 1973.

The most general illustration of cautious demand management is perhaps the fact that, after the stagnation of output and the sharp rise in unemployment in 1971, the authorities aimed at an increase in real GDP of 3 ½ per cent in 1972, which allowing for the shortening of the working week was only moderately higher than the underlying growth of capacity. As it turned out, the rise in GDP was even smaller, about 2 per cent.

The slow growth of activity was accompanied by growing economic slack and higher unemployment. The size of the margin of slack is, however, difficult to estimate. On the basis of a rough comparison between the growth

1 Including Central Government, local authorities, Social Security, investment funds and residential construction.

of capacity as estimated by the medium-term survey published in 1970 and the actual growth of GDP in 1971 and 1972, the margin of slack at the end of the latter year would fall within the range of 4 to 6 per cent of potential output[1]. This, however, is clearly an over-estimate. The reduction in weekly working hours accelerated in 1971 and 1972 as compared with the expectations for the period 1970-1975 as a whole in the medium term survey. Moreover, it cannot be excluded that the underlying productivity growth in industry in the last few years has been somewhat less strong than earlier. The authorities estimate the margin of unused potential at around 3 per cent in 1972.

The rise in unemployment, although stronger than during any other post-war recession, has been relatively moderate in relation to the marked slowdown of the growth of output. This, of course, reflects the reduction in weekly working hours and certain other factors discussed in Part II—Changes in the labour market. It is also possible that there has been a certain hoarding of labour in manufacturing, although its importance is difficult to assess.

As noted, demand management policy in recent years has been importantly influenced by the priority attached to a structural improvement of the balance of payments and the price performance. In these respects, the authorities have had a certain measure of success.

Balance of payments

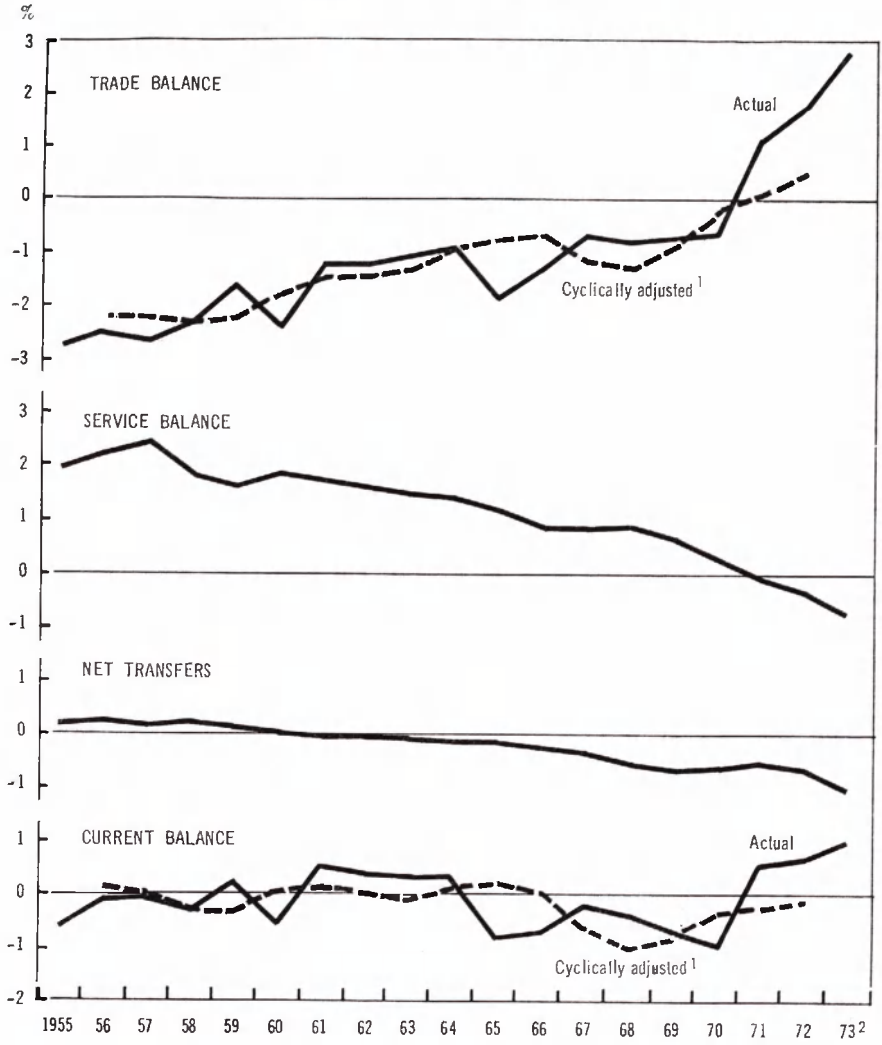
In the second half of the 1960s the current account showed deficits averaging around ¾ per cent of GDP, and with a weak capital account also, there were recurrent strains on official foreign exchange reserves. The difficulties increased during the upheaval in international financial markets in 1969; during the first 9 months of the year Sweden's official reserves fell to the equivalent of less than one month's imports. But in the course of 1970, the current account swung into surplus and the capital account also improved in response to tight liquidity conditions and the introduction of certain restrictions on capital exports in September 1969[2]. The improvement continued in 1971 and 1972 with both a substantial surplus on the current external account and a net inflow of capital. At the end of 1972, official foreign exchange reserves (including gold, IMF position and SDR's) amounted to $ 1 600 million or some 2½ months merchandise imports. The first quarter of 1973 saw a further considerable increase in reserves reflecting both a continued rise of the current surplus and higher capital imports.

The current account improvement from 1970 to 1971 was to a large extent due to cyclical factors, in particular a fall in inventory formation (with a high import content) and in demand pressures in Sweden relative to those of other countries. To get an idea of the underlying position, adjustment for these and other temporary factors are required. Tentative estimates by the OECD Secretariat suggest that the underlying position, after a deterioration between 1965 and 1968, has improved through 1972. (See Diagram5).

1 The medium term survey forecast a 4 per cent real GDP growth between 1970 and 1975. The actual advance in 1971 and 1972 was about 1 per cent a year as estimated from the expenditure side or 1.7 per cent a year as estimated from the production side.

2 For details see OECD Economic Survey of Sweden, April 1970 p. 31.

Diagram 5 **Current External Account**
Per cent of GDP, current prices



1 Three years moving average of cyclically adjusted figures.
2 1973 forecasts by the Secretariat.

NOTE A description of the method of adjustment for cyclical variations is found in Annex II to OECD Economic Survey of Sweden, April 1972.

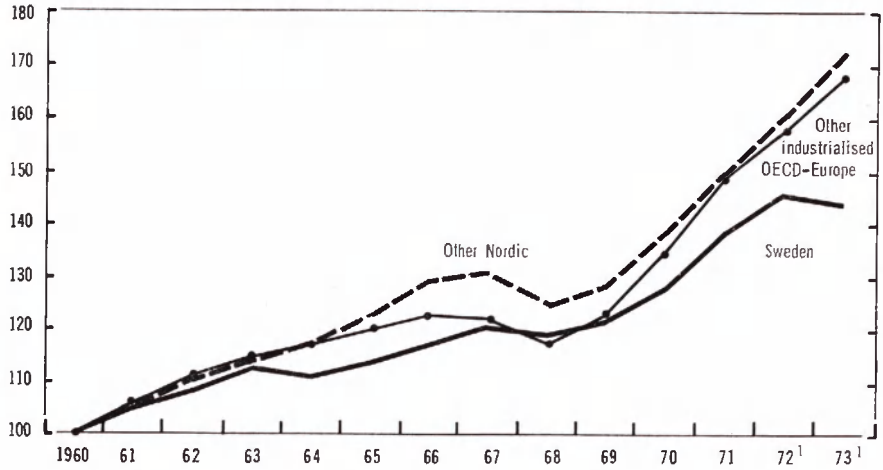
Sources: Swedish National Accounts and OECD Secretariat.

But the estimates are uncertain and should be interpreted with some caution as there is no universal and commonly agreed method for adjusting the balance of payments for cyclical fluctuations.

Cost/price performance

As in most other countries, the rise in costs and prices has accelerated in recent years. Over the last decade the rise in consumer prices has been roughly in line with trends in other European Member countries, but Sweden may have seen a faster rise in food prices and a somewhat slower advance in non-food prices. The rise in hourly wage costs has increased at least as fast as elsewhere, but with productivity increases in the Swedish manufacturing industry comparatively high the increase in unit labour costs (taking into account changes in exchange rates) has been slower than in other European Member countries, particularly since the late 1960s. The adjustment of the parity of the Swedish Krona in February 1973 entailed a slight effective devaluation[1], increasing the competitive edge of Swedish exports.

Diagram 6 **Unit Labour Cost in Manufacturing**
SDR Units, Index 1960 = 100



1 Estimates and forecasts by the Secretariat.

NOTE For the two groups of countries, the figures have been weighted together according to their weights in the OECD index of industrial production. Unit labour cost is defined as the total cost of wages, salaries and associated employer outlays per unit of output in the manufacturing sector. For the purpose of international comparison national data have been converted into SDR at current exchange rates. Due to considerable problems regarding the comparability and precision of indicators, the estimates should be considered as a crude measure of trends.

Source: OECD Secretariat.

1 The gold parity of the Krona was depreciated by 5 per cent. However, by early April the spot rate against other currencies on average had depreciated effectively by only 2 per cent.

II CHANGES IN THE LABOUR MARKET

Taking the last 30 to 40 years as a whole, Sweden can no doubt claim to have had one of the best employment records in the whole OECD area. This has not only been reflected in relatively low unemployment rates but is also suggested by comparatively high participation ratios notably of women which in turn indicates a more active involvement of married women in social and economic life. Observers usually ascribe the favourable employment record to the flexibility and efficiency of demand management policies as well as to the very active use which has traditionally been made of manpower policies.

In the recent past labour market and manpower authorities have importantly contributed to cushion the impact of fluctuating demand on the level of unemployment by absorbing redundant labour during slack periods and releasing labour in periods of excess demand. This buffer function has been exercised through variations in the number of people engaged or involved in the various employment and training schemes. At the same time labour mobility has been promoted and structural shifts in the economy favoured. The introduction of greater flexibility in working time and separate taxation of married women has provided additional incentives to seek gainful employment. The tax reform on 1st January, 1971 was certainly a major factor behind the sharp increase in the participation ratio in 1971 but even in the following year there was a further decline in the number of potential job seekers[1].

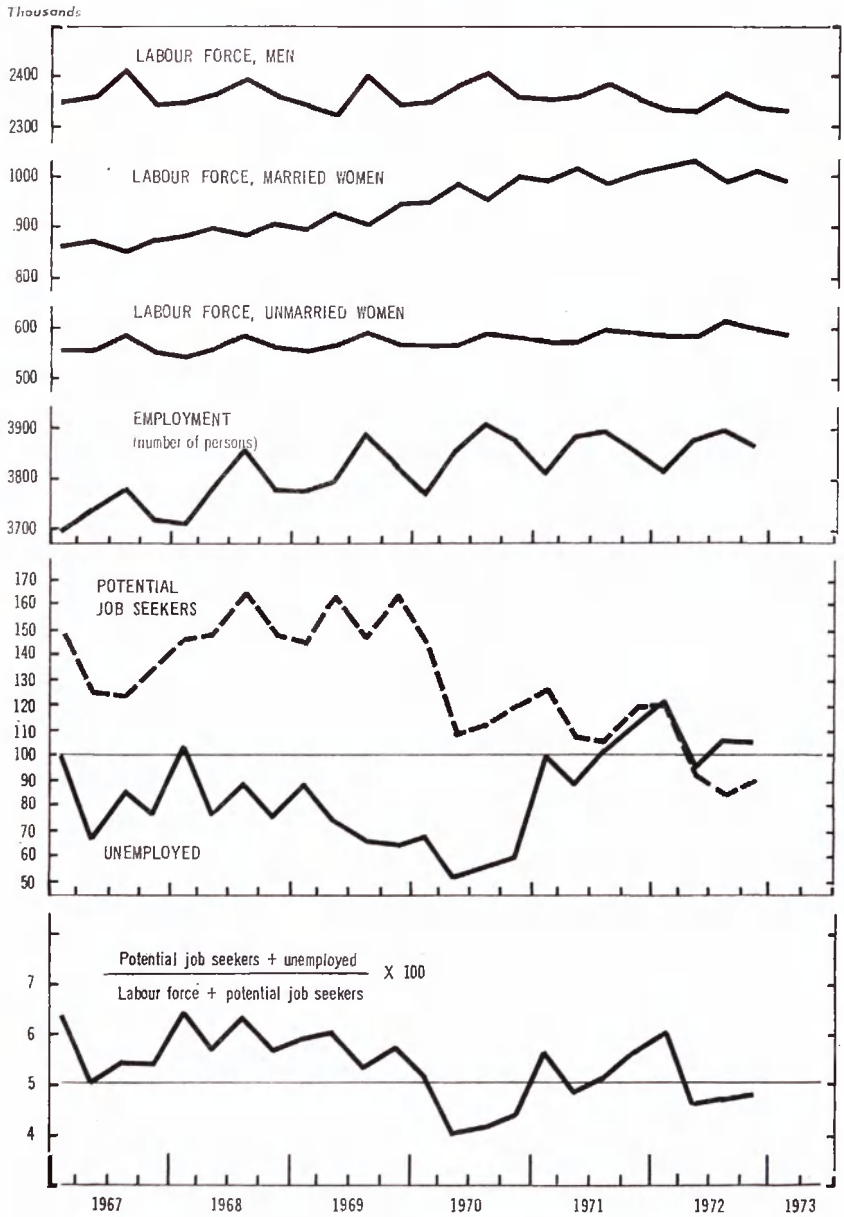
On the other hand, the number of actively employed persons has been stagnating during the last couple of years. With 2.7 per cent of the labour force out of work in 1972 the previous unemployment peak of 2.2 per cent in 1968 was significantly exceeded. However, considering the increased participation ratio of married women and the relatively high margin of slack prevailing in the economy, the rise in unemployment has been lower than past relationships between GDP gap and employment level would have suggested. A comparatively low " cyclical " share in present unemployment is also suggested by a significant rise in certain types of " structural " unemployment. The obvious implication seems to be that it will not be easy, by general reflationary measures alone to reduce unemployment to the low levels experienced in earlier years. The following section attempts to analyse in more detail the nature and causes of the shifts in labour market trends.

Nature of the unemployment problem

In view of the exceptionally slow growth of output in 1971 and the continued increase in the female labour participation ratio, the rise in unemployment has, as already noted, been surprisingly small. According to labour force sample surveys about 105 000 persons were recorded unemployed or only twice as much as the low figure registered during the preceding boom;

1 According to labour force sample surveys potential job seekers are those persons who are not counted as unemployed but who indicate that they would have been looking for gainful employment if there had been a real chance of finding a job.

Diagram 7 **Labour Force and Employment**
Not adjusted for seasonal variations



NOTE Figures through 1969 concern all persons from 14 years of age, 1970 onwards cover age groups 16-74 years only.

Source: Labour Force Sample Surveys.

and total manpower reserves (potential job seekers plus unemployed persons) were actually smaller than during the less pronounced 1967-68 recession. This is particularly noteworthy since the last two years have seen a sharp fall in labour intensive building and construction activity. The slump in building

Diagram 8 **Employment by Industry**

NOTE This the annual rate of increase as estimated by the log trend value for 1960-1971.

Sources: Swedish National Accounts and OECD Secretariat.

activity was, indeed, associated with a sharp rise in the number of unemployed building workers in 1971 which was partly reversed in 1972 under the impact of special stimulative measures. Employment in manufacturing was, on the other hand, well maintained[1] and employment in the primary sector receded tess than previously.

The relatively moderate increase in " cyclical " unemployment can be attributed to three main factors: the contractual shortening of the working week, a marked decline in immigration and a strong expansion of labour market training schemes. As from the beginning of 1972 the number of work hours per week was cut from 42½ to 40 hours. Net immigration fell from 48 700 in 1970 to 3 000 in 1971 and gave even way to a net emigration of some 12 000 persons in 1972. The number of registered foreign workers declined by some 10 000 between 1st January, 1971 and 1st January, 1973 after a very rapid expansion during the preceding three years. Manpower training courses were expanded to cover some 55 000 persons in February as against some 40 000 two years earlier and about 35 000 at the trough of the 1967-68 recession. Great efforts were made to step up training of young people through special courses and subsidy payments to enterprises which increase employment of school leavers.

The counterpart of the relatively low rate of purely cyclical unemployment has been a rise in the " structural " component of unemployment. Apart from the fact that there seems to be a growing propensity of unemployed persons to register with Labour Exchange Offices because of higher benefits, unemployment figures have been swollen in recent years by a rising share of long-term unemployed persons. This means that the same unemployment figures recorded during a certain period indicate a smaller number of incidences of unemployment than previously. The lengthening of individual unemployment periods in turn could suggest that unemployed persons take more time to look for a new job encouraged by higher unemployment benefits. A particular feature of the 1970-1971 period was the unusually sharp increase of registered unemployment among white collar employees. On the other hand, except for building workers, demand for manual workers was maintained at a high level.

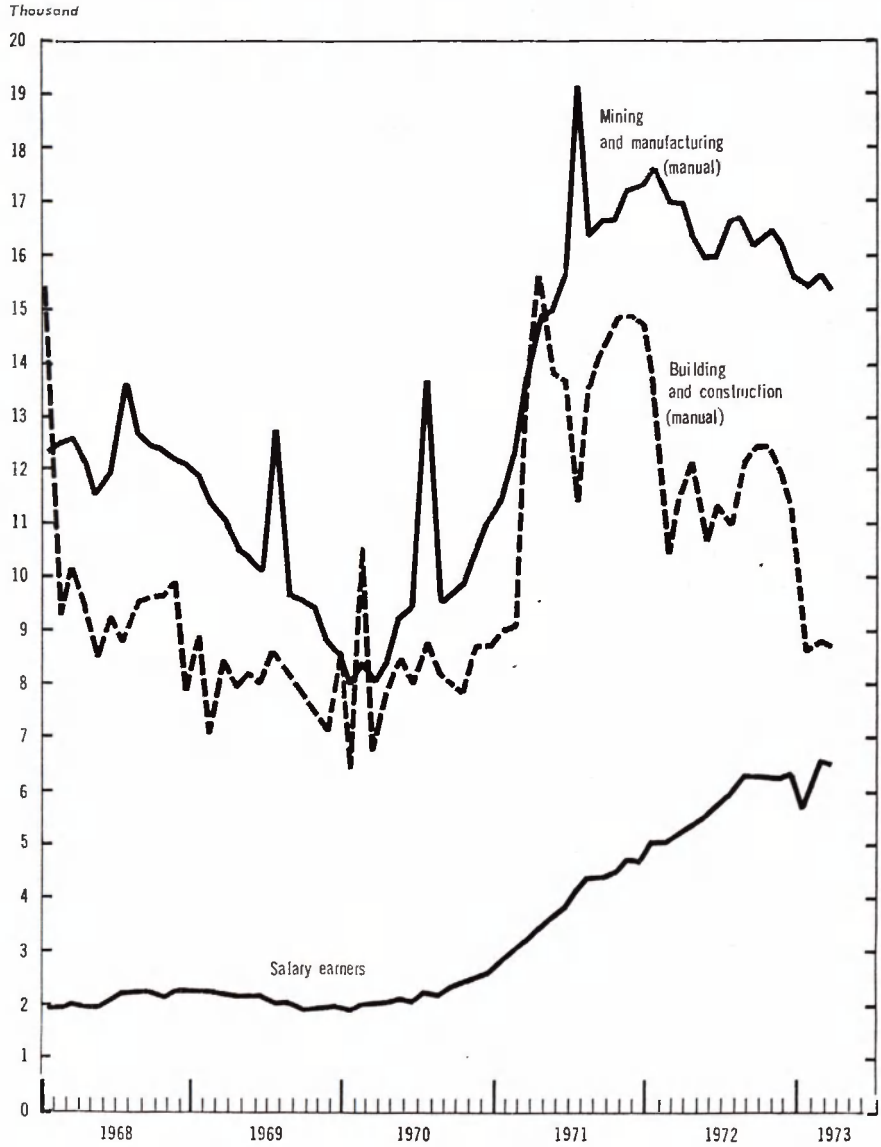
Indeed, as can be seen from Diagram 10 the number of vacancies after a rapid fall from early 1970 to the first quarter of 1971 established at about the same level as in 1968. In manufacturing alone the number of vacancies was on average for 1971 and 1972 only slightly lower than during the 1966-1968 cycle. It is also interesting to note that during the last recession the easing in labour market pressures (as measured by the vacancy/unemployment ratio) was more pronounced in the four largest urban areas than in the northern part of the country pointing to a certain narrowing of regional differentials.

Further examination of the exceptionally good Swedish labour market statistics and various studies published by the Research Department of the National Labour Market Board also indicate that:

(*i*) Part-time employees have a significantly higher rate of unemployment than full-time employees.

1 In 1971-1972 registered unemployment among male workers in manufacturing was not significantly higher than in the previous (and milder) setback.

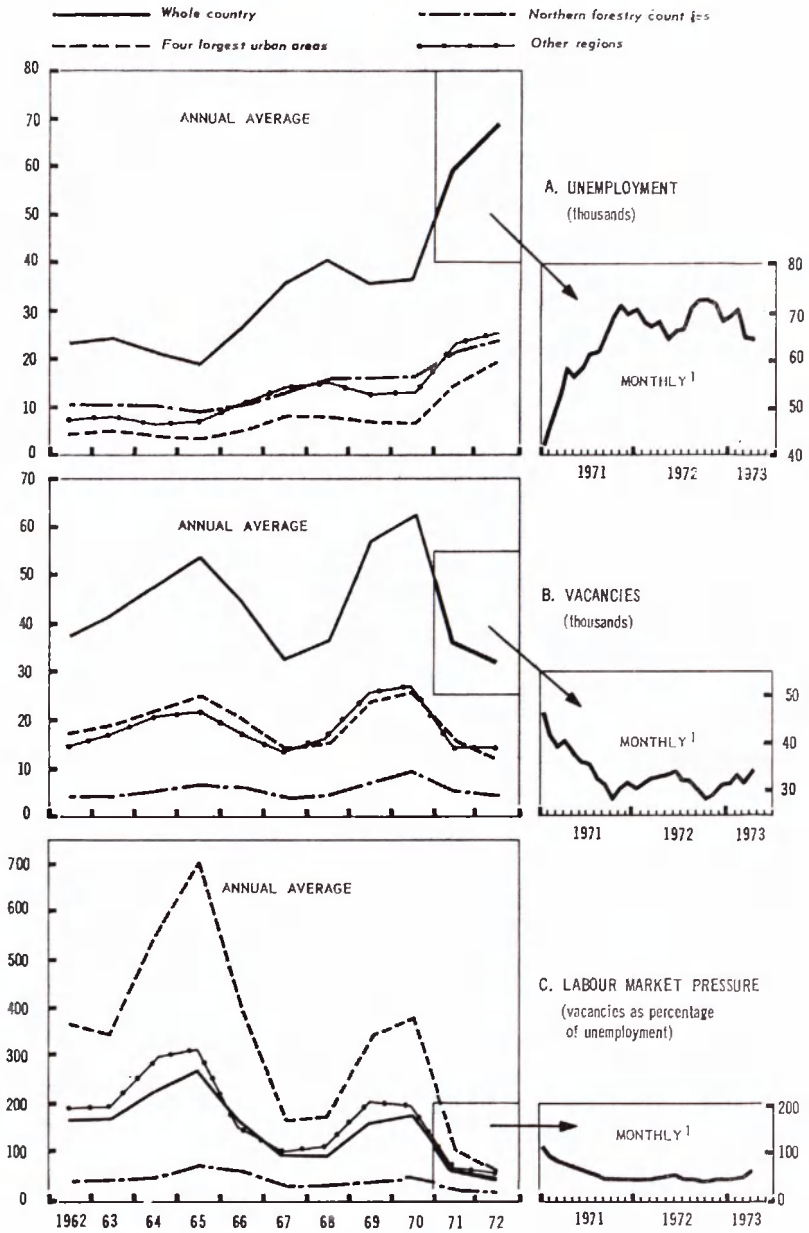
Diagram 9 **Unemployment by Professional Groups**
Registrations at exchange offices, seasonally adjusted



Sources: Swedish Labour Market Statistics and OECD Secretariat.

(*ii*) Rates of unemployment among persons with elementary or primary education have remained much higher and have increased more than those relating to persons with secondary or higher education.

Diagram 10 **Registered Unemployment and Vacancies**



1 Whole country, adjusted for seasonal variations.

NOTE Horizontal scale enlarged for monthly panels.

Sources: Labour Market Statistics (National Labour Market Board) and OECD Secretariat.

(*iii*) Unemployment among white collar employees—although higher than earlier—is much less frequent than for blue collar workers (in 1972 the rate was only a third).

(*iv*) The number of registered unemployed women has increased markedly since 1969 (and rose through 1972). Labour force sample surveys point to a less rapid increase. The difference between the two series is too big to be wholly explained by changes in statistical coverage[1] and may partly be due to the above mentioned higher propensity to register as unemployed.

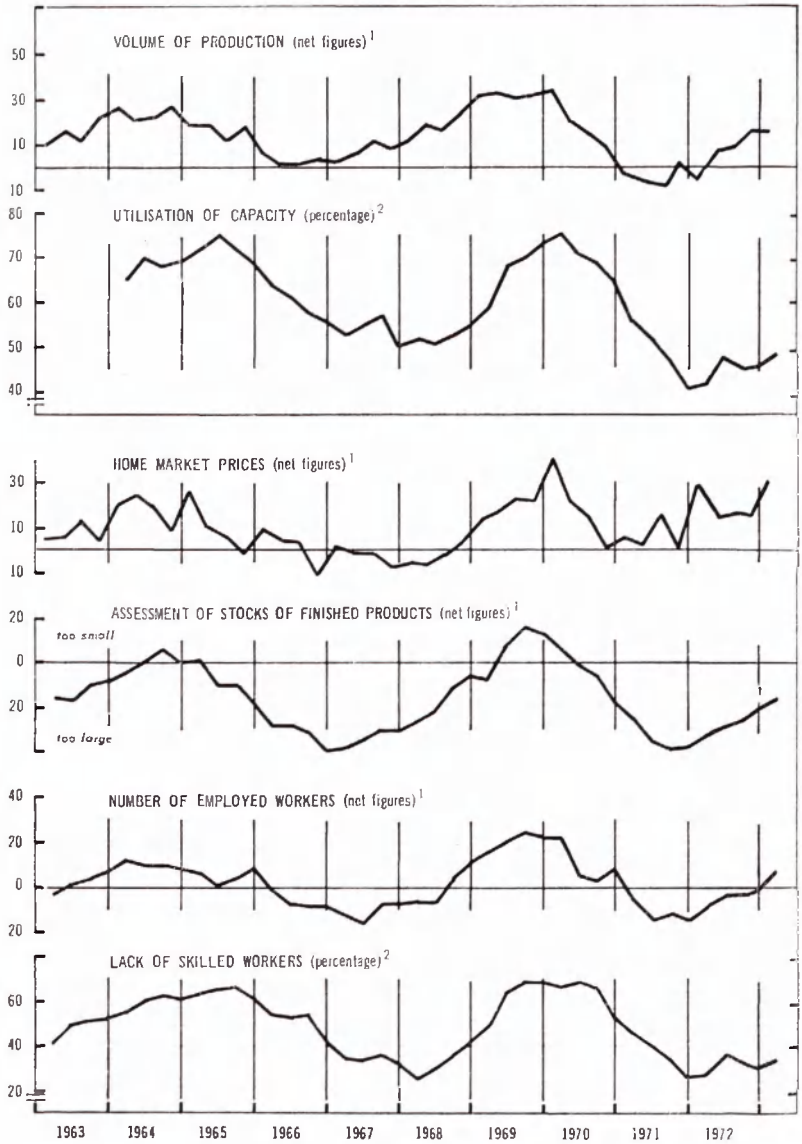
From the above it can be inferred that an important part of the present high unemployment figure cannot be attributed to the business cycle in a narrower sense. Weaker medium-term trends in building and construction and public sector employment and an acceleration of structural changes within the labour force are major factors behind the present higher unemployment level. Although purely " cyclical " unemployment would, thus, seem to be less important than in earlier periods of slack there is no doubt that the weaker employment trends in recent years also reflect the slower growth of overall demand. The more cautions demand managment policies adopted to restore better external and internal financial balance do not indicate a shift in policy emphasis. Clearly, a higher level of employment can in the longer-run only be sustained if Sweden's industry remains viable and competitive in world markets.

III THE SWEDISH ECONOMY IN 1973

An export-led recovery in manufacturing developed rapidly in the last months of 1972 and early 1973. Between the third and fourth quarters of 1972 merchandise exports rose at an annual rate of some 30 per cent in value; the first quarter of this year saw a further steep increase to a level more than 30 per cent over a year earlier and, adjusted for seasonal variations, about 23 per cent above the 1972 quarterly average. Although part of the export increase has been taken from stocks, there has also been a marked revival of industrial production. The business tendency survey in manufacturing in December confirmed the sharp rise in production but, somewhat surprisingly, showed less optimistic expectations concerning the first quarter of 1973; stocks of finished goods were judged to be too high and the order inflow too low. Nevertheless, enterprises seemed to expect a sharp increase in their selling prices in the immediate future.

1 Some white collar unemployment insurance funds have been included in the unemployment statistics since 1969.

Diagram 11 **Business Tendency Surveys**



1 Net figures indicate the difference (percentage points) between the weighted proportions of the firms reporting positive and those reporting negative changes in the items concerned (firms reporting no change being left out of account).

2 Percentage figures indicate the weighted proportion of firms reporting full capacity and lack of skilled workers respectively.

Fiscal and monetary policies

The 1973/74 central government budget proposal presented in January represented a marked tightening of fiscal policy; on a calendar year basis, the demand impact of the budget is now officially estimated to fall from 2.0 per cent of GDP in 1972 to 0.1 per cent in 1973 (Table 2). On the other hand estimated demand impact of the total public sector including that of residential construction[1] is expected to remain virtually unchanged. The planned increase in the

1 Official estimates of budget impact based on the assumption that all categories of expenditure on goods and services have approximately the same impact on demand, that all taxes reduce demand to the same extent and that transfers may be considered as negative taxes. Dwelling construction has been included due to the extensive direct and financial public control with this activity.

NOTE Revenue and expenditure data for 1971 and earlier as published in previous revised national budgets.

Source : Revised National Budget for 1973 and earlier.

1 Residential construction is heavily influenced by government policy and is therefore usually included in the estimate of policy impact in Sweden.

volume of public sector expenditure on goods and services is small (2.5 per cent) with a 3.5 per cent rise in consumption and a 1.5 per cent fall in investment. Housebuilding after the revival in 1972 is expected to fall by 4.5 per cent in real terms in 1973.

The less expansionary central government budget policy has been supplemented by various selective measures to stimulate demand in certain areas, especially business fixed investment, in line with the importance the authorities attach to maintaining continued strong industrial growth.

(*i*) Extension to 1st July, 1973, and increase from 20 to 30 per cent of the special depreciation allowance for investment in machinery and equipment by manufacturing[1]. Introduction of a special 10 per cent depreciation allowance for industrial investment in buildings. Use of investment reserve funds for building extended to the end of April 1974.

(*ii*) Measures allowing the National Pension Insurance Fund to invest in industrial shares (to be proposed in the Spring of 1973).

(*iii*) Special tax allowances for research and development investment in industry.

(*iv*) Maintenance of easy credit policy, notably for investment financing (e.g. industrial bond issues).

The recent parity change of the Swedish Krona, entailing some improvement of the competitive position of Swedish industries, should also serve to stimulate industrial investment.

In the absence of new restrictive measures, the easy monetary and credit conditions could enable a strong credit expansion. The reserve position of the banking system, influenced by a sharp increase in deposits, remains well above the rates required by existing reserve requirements. In the latter part of 1972 the money supply (broad definition) rose at an annual rate of 12 per cent, an acceleration of some 2 percentage points from the average rate of increase experienced during the previous year. This rise in the money supply was closely related to the growth of bank credit and in 1972 was three times as high as in 1970 which—it is true— was marked by very severe restrictions on credit expansion.

Despite the relatively cautious fiscal policy stance that has been maintained during the recent recession, the overall deficit of the central government has risen sharply, partly reflecting the revenue shortfall associated with the slow growth of activity and incomes. In the current fiscal year, the deficit is officially expected to rise to almost S.Kr. 7½ billion (3¾ per cent of GDP). The deficit is expected to remain high (at S.Kr. 5.7 billion) in 1973/74. Given the existing degree of monetary ease, it is clearly desirable that the budget deficit should as far as possible be financed by long-term borrowing from the non-bank sector. The importance of financing the deficit in this way is underlined by the likelihood that official foreign exchange reserves will continue to rise, reflecting a current external surplus and net foreign borrowing. In view of the risk of an excessive monetary expansion, there may well be need for measures to reduce banks' free reserves.

1 Over and above normal depreciation implying that enterprises are allowed to write off goods purchased before 1st July 1973 by 130 per cent.

Short-term prospects

The cautious posture of fiscal policy is illustrated by the fact that, on the basis of present policies, the authorities expect real GDP to grow only somewhat faster than capacity (Table 4), despite the existence of an important margin of economic slack. As noted earlier, public investment is being reduced and a fall in residential construction is also envisaged. Exports, business fixed investment and stockbuilding are expected to be the main dynamic elements. Private consumption should also show a marked recovery more or less in line with GDP. Disposable household incomes are expected to increase more than earlier because of a slower increase in net direct tax payments (reflecting reimbursement of excessive payments in 1972) and because there will be no further decline in paid labour input. On the other hand, wages and salaries could decelerate somewhat; wagedrift is unlikely to be strong given the labour market situation, and the increase in negotiated rates should also be moderate since 1973 is the last year of the current three-year (frontloaded) settlement.

Effect of change in terms of trade[2]	..	0.1	0.4	–0.2	0.0	..
GROSS NATIONAL PRODUCT	..	5.0	5.1	–0.2	2.2	..

1 Change in stockbuilding as per cent of previous year's GDP.
2 Change in the effect as per cent of previous year's GDP. The effect of change in terms of trade is estimated as the difference between exports deflated with the import price index and exports deflated with export price index. Exports deflated with the import price index—also called real export income—is a measure of the external purchasing power of export earnings. The estimates are based on national accounts figures for exports and imports of goods and services.

There are, as always, many uncertainties. As in many other countries, the personal savings ratio rose sharply in 1971 and remained high in 1972. The official forecast assumes little change in 1973, and it is difficult to argue against this assumption since the reasons for the earlier rise in the savings ratio are not very clear. But to the extent that it reflected higher unemployment and more uncertainty about the employment outlook, the savings ratio could well fall with the recovery of activity in 1973, entailing a stronger advance in private consumption. On the other hand, the rise in consumer spending in real terms may fall short of the official forecast because of a somewhat stronger rise in prices than assumed. There could therefore be deviations from the official private consumption forecasts in both directions even through consumers spending seemed to have remained rather sluggish during the first few months of the year.

The rise in merchandise exports, on the other hand, officially estimated at 13.5 per cent in volume between 1972 and 1973, may well have been underestimated. The OECD Secretariat expects the Swedish export market to grow by around 13 per cent in volume, and a certain gain in market shares would seem likely in view of the existing export capacity, the strong competitive position of Swedish industry and the marked loss in shares experienced in 1972. The rise in value will be affected both by the parity change of the Krona and the devaluation of the dollar. Measured in SDR units export prices may therefore rise less than the average for OECD.

As business fixed investment is typically strongly influenced by export prospects, industrial fixed asset formation is likely to increase significantly this year although the rate of capacity utilisation is relatively low at present. In assessing the future strength of investment it should also be taken into account that industrial fixed asset formation rose, although not very fast, both in 1971 and 1972, in contrast to its behaviour during the previous recession. Capacity therefore continued to grow rapidly in the last two years although environmental investment has accounted for a rapidly growing proportion of investment expenditure. Nevertheless, it would not be surprising if business fixed investment rose even faster than assumed by the authorities.

On balance, given notably the prospect of very strong expansion of activity in OECD countries and hence of Swedish exports, real GDP should rise significantly faster than capacity. Labour demand should therefore strengthen, particularly in manufacturing; but the rise in industrial employment may not be very marked because there is probably a certain amount of slack that can be taken up. Moreover, large segments of the labour force, especially young people, are apparently not very interested in manual work in industry. It is therefore possible that shortages of labour, notably skilled workers, will be felt in manufacturing at an early stage of the recovery. Employment in the labour intensive building and construction will probably fall while employment in the private service sector should continue its secular growth. On balance, overall unemployment, although decreasing, may still remain relatively high reflecting the persistence of structural imbalances in the labour market.

The number of persons covered by measures to create, promote or protect employment in February 1973 was still rather high (Table 8). A return to pre-recession levels does not seem likely as the " structural component " also in this field seems to have expanded—mainly since a rising number of handicapped, old or " unadapted " persons are taken care of permanently by the labour market authorities. Nevertheless the scaling down of stimulative measures in 1973 may be expected to entail a reduction in the number of persons under relief works and retraining, etc. In the first instance these will add perhaps some 20 000 persons to the natural increase in the labour force.

As indicated in Part I, the current external account strengthened between 1968 and 1971, not only as actually recorded but also the underlying position, i.e. after adjustment for cyclical factors both at home and abroad. The underlying balance may have improved somewhat further in 1972. The recorded current surplus continued to rise whilst Sweden's relative cyclical position probably changed little. According to the official forecast the current surplus in 1973 would attain a level corresponding to some ¾ per cent of GDP. Given the buoyant export outlook, the trade surplus should rise, although imports will revive in line with the recovery of activity and stock-building. The terms of trade are officially expected to remain roughly unchanged. The balance of services may deteriorate in line with the long-term trend, and net transfers to other countries (mainly development assistance) should continue to rise, perhaps totalling about 1 per cent of GDP in 1973. Nevertheless, on the strength of present exports, it would seem

that the current balance may well turn out to be even more favourable than envisaged by the authorities. In view of the likely continued net capital inflow Sweden's overall reserve position may therefore see a further marked strengthening.

IV CONCLUSIONS

The last few years have been an important period of adjustment after the excess demand conditions which had developed in the mid-1960s. The current account of the balance of payments has improved significantly, in line with the high priority the authorities have attached to this objective. The improvement can to some extent be attributed to the fact that, compared with longer-term trends, demand pressures in Sweden have been lower than elsewhere. But as far as one can judge, the underlying position has also strengthened. Reflecting, among other things, the rapid growth of industrial productivity throughout the past decade the relative cost position of Swedish manufacturing has clearly improved in recent years. The current account after adjustment for cyclical factors may now be in a rough equilibrium position with a surplus on goods and services sufficient to cover official development assistance which is now approaching 1 per cent of GNP.

The strengthening of the balance of payments has been assisted by government policy. The stimulus imparted to the economy via the public and the

government controlled housing sector has been much weeker than in earlier recessions. This may reflect a certain saturation in residential construction and related infrastructural investments but does also reflect a more cautious stance of overall demand management. A major aim has been to create the necessary room for rapid expansion of exports and productive investment and to maintain a favourable environment for rapid growth of industrial productivity. The authorities wished to avoid increases in expenditure, such as for instance public consumption, which it would have been difficult to reduce again. Alternatively, a cut in taxation, which could have served to stimulate private demand, would have also been difficult to reverse in later years. Measures taken to support activity and employment have therefore been of a selective rather than of a general nature. Industrial investment continued to grow during 1971 and 1972 in contrast to the decline experienced during the 1966-67 recession. Policies to stabilise employment in the building industry included the abolition of restrictions on non-priority building and the speeding up of public relief works.

While the economy should now be well placed to benefit from the rapid expansion of world trade and to resume stronger growth without running into balance-of-payments difficulties, restoration of a better price performance would seem to constitute a major problem. As far as flexibility of demand management policy and the use of manpower policies are concerned, Sweden is probably in a better position than most other Member countries and the centralised nature of wage bargaining and the reasonable attitudes of Swedish trade unions attenuate the virtual absence of a prices and incomes policy. However, like other small economies with a large foreign trade sector, the success of any stabilisation measures will heavily depend on developments of prices in the bigger countries.

A particular problem which may complicate the task of anti-inflationary policy is the imbalances that have developed in the labour market. Although unemployment may tend to remain higher than usual for some time to come, a shortage of labour, notably skilled workers, may well appear at an early stage of the recovery, entailing stronger wagedrift, probably already in the present year. A special feature of the situation is that the young people entering the labour force are reluctant to do manual work in industry and are primarily seeking other employment. Given the free movements of labour between the Nordic countries, immigration of skilled workers may ease the situation somewhat, but it may well be that further adaptations of working conditions, remuneration methods, and decision-making processes in industry may be required to attract workers to that sector. It may also be that a relative increase in wages in industry will be necessary. But a change in income distribution is not easily achieved: most groups try to protect their relative position and such efforts may constitute an important source of inflation. It would seem that, in this situation, a closer co-operation between the various trade union organisations as well as the other parties on the labour market could play an imporant role to ensure less inflationary adjustments of wage differentials to desired structural shifts in the economy.

1 Change in sample from 1966 for columns 49-56. Figures for 1966 according to previous sample: 49:1 502,50:679,51:8 760,52:2 759,53:6 001,54:2 187,55:3 814,56:2 409.
2 End of February, May, August, November, yearly figures are averages of quarterly stock-taking.
3 New index, 2nd quarter 1968 = 100, based on a different sample and new definitions.
4 Break in the series from 1970 due to new definition.
5 Estimates for 1972 derived from a new sample survey. The figures are not comparable with those of previous years.

1 Changes in the statistical reporting system resulted in exceptional additions to the export figures, about Kr. 150 million for 1968, concerning mainly September. Adjusted for this the value index and the volume index are 214 and 190 respectively for the 3rd quarter 1968, and 222 and 198 respectively for 1968 as a whole.

1 The lowest series.
2 Yearly figures are averages of mid-month figures.
3 Including some assets not included in liquid assets as defined in column 140.
4 Owing to modifications of the banks' reporting of assets and liabilities the figures as from beginning of 1969 are not comparable in all respects with earlier periods.

1 Does not include total net migration between Finland and the other Nordic countries.
2 1969.
3 Adjusted data on the census taken on 31.12.1970.
4 GDP in purchasers' values.
5 Private and socialised sector.
6 Census results on 14.3.1971.
7 According to the definition used in OECD Labour Force Statistics: mining, manufacturing, construction and utilities (electricity, gas and water).
8 At current prices and exchange rates.
9 1967.
10 The estimates for GDP by sector for Switzerland have been published in "La Vie économique", November 1969.
11 GDP at market prices.
12 Net domestic product.
13 1970.
14 Including stock appreciation.
15 Fiscal year-Beginning July 1st.
16 1962-1967.
17 1965.
18 1968.
19 1966.
20 1964.
21 Including Luxembourg.
22 Dwellings started.
23 At constant (1963) prices.
24 Excluding transfer costs of land and existing assets.
25 1964-1968.
26 Government and government enterprise expenditure on machinery and equipment is included in government current expenditure.
27 "Other construction" included under "machinery and equipment". Work in progress on heavy equipment and ships for the domestic market are included in fixed asset formation.
28 "Other construction" included in "residential construction".
29 Including transfer costs of land.
30 General government.
31 Including depreciation.
32 Industry.
33 Monthly.
34 Manufacturing.
35 Including bonuses.
36 Hourly rates in manufacturing.
37 Hourly wages rates, unskilled workers.
38 Hourly rates in manufacturing, excluding family allowances.
39 Monthly earnings in manufacturing. Cash payments including bonuses, regular workers.
40 Hourly rates in industry, males.
41 Males.
42 Manufacturing, including salaried employees.
43 Mining and manufacturing, males.
44 Hourly rates.
45 Hourly rates in manufacturing, males.
46 Goods and services, including factor income.
47 Including reserve position in the IMF and special drawing rights.
48 February 1972 - February 1973.
49 1965-1969.
50 According to the DAC definition. Including flows to multilateral agencies and grants by voluntary agencies.
51 Not Development Assistance Committee member.
52 Considered as a developing country for purposes of DAC reporting.
53 Values, percentage change. Figures are subject to many limiting factors. For an explanation see OECD Economic Outlook, simple definition, December 1970, pp. 65 and 69.
54 The growth which would have occurred in a country's exports if it had exactly maintained its share in total OECD exports to each of 19 broad geographical zones.
55 The difference between the growth rates of markets and exports.
56 January 1972 - January 1973.

NOTE Figures within brackets are estimates by the OECD Secretariat.

# of economics and statistics

MAIN ECONOMIC INDICATORS

This monthly publication, based on the most up-to-date techniques of tabular and graphical presentation, is designed to provide at a glance a picture of the most recent changes in the economy of the O.E.C.D. countries, and a collection of international statistics on the economic developments affecting the O.E.C.D. area in the past few years.
The indicators selected cover national accounts, industrial production, deliveries, stocks and orders, construction, retail sales, labour, wages, prices, domestic and foreign finance, interest rates, trade and payments. Quarterly supplements provide additional material on consumer prices and industrial production.

FOREIGN TRADE STATISTICS BULLETINS: SERIES A, B, and C

Series A - Overall trade by countries (quarterly) provides an overall picture of the total trade of O.E.C.D. countries (without commodity breakdown) analysed into flows with countries and country groupings of origin and destination.
The analysis is in terms of a standard geographical classification, in tables covering the latest available four years, twelve quarters and sixteen months. A monthly supplement brings the tables up to date in between successive quarterly issues.
Series B - Trade by commodities, Analytical abstracts (quarterly) is designed for a general analysis of the pattern of trade flows of O.E.C.D. countries, individually and in groups, by main commodity categories and partner areas and countries. Both the commodity categories and the partner countries and areas are defined in terms of standard nomenclatures, but for each reporting country only those which are significant are shown. The series is issued in six booklets, each covering several countries, in the order of availability of the basic data.
Series C - Trade by commodities, Market summaries (half-yearly) provides detailed information on the trade of O.E.C.D. countries by main commodities and partner countries. The series appears in three volumes, respectively covering trade by major commodity categories (values only) and by S.I.T.C. groups, sub-groups and items (quantities and values, one volume for exports and one for imports).
Data are arranged in synoptic tables, bringing together the countries comprising the market for a given commodity, as outlets and/or sources of supply, both within the O.E.C.D. area and in trade between O.E.C.D. countries and the rest of the world.

STATISTICAL YEARBOOKS

Historical Statistics (every two years) bring together, in two volumes, quarterly and monthly data over the last decade for all series shown in *Main Economic Indicators* and its *Industrial Production* supplement, respectively.
In addition, both volumes show annual data over a longer time-span, and a selection of calculated rates of change. In between two issues they are kept up to date by supplements inserted into current issues of *Main Economic Indicators*.
National Accounts of O.E.C.D. countries (annual) shows for each O.E.C.D. country and for major groups of Member countries the main national accounting aggregates, in a standardized form, over the last decade (occasionally, over a longer time-span).
In addition, special tables contain various analytical measurements, such as growth triangles, price and volumes indices, and ratios of selected aggregates to totals.
Labour force statistics (annual) gives an overall view, on the basis of standardized data, of the manpower and employment situation over the last decade in the O.E.C.D. countries. Data are shown, in particular, for total population, components of population changes, age structures, total and civilian manpower, unemployment, and employment (both in total and with a breakdown by activity and professional status and—in the case of wage and salary earners— by industry).

ORGANISATION DE COOPÉRATION ET DE DÉVELOPPEMENT ÉCONOMIQUES

OECD ECONOMIC OUTLOOK

Each July and December the OECD ECONOMIC OUTLOOK surveys the latest economic developments in the OECD area and, by means of an integrated set of quantitative forecasts, assesses future prospects. In addition, there are frequently special studies designed to assist the interpretation of economic trends.
