ECONOMIC SURVEYS BY THE OECD

NETHERLANDS

1962

PUBLISHED BY
THE ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT
2, RUE ANDRE PASCAL - PARIS 16e

The Organisation for Economic Co-operation and Development was set up under a Convention signed in Paris on 14th December 1960 by the Member countries of the Organisation for European Economic Co-operation and by Canada and the United States. This Convention provides that the O.E.C.D. shall promote policies designed:

- *to achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;*
- *to contribute to sound economic expansion in Member as well as non-member countries in the process of economic development;*
- *to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.*

The legal personality possessed by the Organisation for European Economic Co-operation continues in the O.E.C.D., which came into being on 30th September 1961.

The Members of O.E.C.D. are: Austria, Belgium, Canada, Denmark, France, the Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States.

This document was approved

VI. LONG-TERM ECONOMIC GROWTH IN THE NETHERLANDS 23

VII. CONCLUSIONS 24

STATISTICAL ANNEX 27

BLANK PAGE

NETHERLANDS

1. The particularly rapid expansion in production in the Netherlands during 1959 and 1960 fell off considerably in 1961. With a few exceptions, this trend was due not to inadequate demand but to supply limitations, mainly caused by a reduction in working hours, as the five-day week became increasingly widely adopted. The increase in demand also slackened as a result of various restrictive measures taken by the authorities. Owing to the limited expansion in supply, however, the pressure on the economy remained severe. In particular, the tension on the labour market grew more serious. Wages increased more than productivity and the fact that the rise in prices remained fairly moderate was largely due to the revaluation of the florin in March 1961 and its effects on import prices. There was also a sharp decline in the surplus on the balance of current payments.

I. RIGIDITY OF INTERNAL SUPPLY

2. Production advanced less swiftly in 1961. In that year the gross national product in volume terms, was only about 2.5 per cent higher than in 1960 when it increased by about 8 per cent. The slackening in the rate of expansion in 1961 was particularly pronounced in industry, where production showed an increase in volume of only 2.5 per cent as compared with 11 per cent for the previous year. The index of industrial production, adjusted for seasonal variations, which was stationary in the early months of the year, showed a definite decline between May and August although it later improved. On the other hand, building improved at the same rate as in 1960 (about 3 per cent in volume) and services expanded a little more rapidly (+ 5 per cent). Agricultural production showed a decline of 3 per cent in 1961, against a rise of 8 per cent in the previous year.

3. According to the calculations of the Central Planning Bureau, industry as a whole was capable of increasing production by 6 per cent in 1961. Productive investment had been on a particularly large scale in 1960 and was continuing at a rapid rate while the active population was expanding considerably (by nearly 2 per cent). In 1961 it showed a natural increase of 51,000 and for the first time since 1950, there was net immigration amounting to 2,000 persons. The unemployment shrank still further, the

number of unemployed falling to 1 per cent of the wage-earning population.

4. The fact that the expansion in industrial production was limited to 2.5 per cent in 1961, instead of a possible 6 per cent, was largely due to the widespread adoption of the five-day working week. This involved an average reduction of 4 per cent in statutory working hours in industry and only to a very limited extent was this offset by an increase in overtime. At the same time, production in a number of sectors (iron and steel, chemicals, cotton and bicycles) could probably have been higher if demand had been livelier. Activity in the sugar industry also declined owing to the smaller beet crop.

5. There was, however, no slackening of tension on the labour market and on average over the year the number of vacancies was three times the number of registered unemployed. The public authorities took various measures to cope with the labour shortage. In particular the recruiting of foreign workers was encouraged (11,000 in 1961 as compared with 6,000 in 1960, mainly Italians and Spaniards). Nevertheless, the measures to encourage emigration (understandable in view of the country's demographic situation) remained in force.

6. In the building industry, the main factor preventing more rapid progress was the shortage of labour. In 1961, the authorities decided that house-building in the non-subsidised sector would be subject to licence. While the construction of subsidised accommodation was strictly controlled, there was a considerable increase in building in the non-subsidised sector.

7. The 3 per cent fall in agricultural production as compared with 1960 was due to a decrease of 9 per cent in open field crop harvests. This was caused mainly by less favourable weather and the reduction in the areas cultivated. On the other hand, market gardening, cattle rearing and milk production continued to expand.

8. In 1962, supply is expected to increase more than in 1961. Productive capacity will continue to increase as a result of the industrial investment of previous years and the labour resources available will increase more rapidly than in 1961 (78,000 workers will enter the labour market as compared with 53,000) owing to the greater natural increase in the active population (post-war peak of high birth-rates) and a larger net immigration of workers. Moreover, the reduction in working hours should be between 1 and 2 per cent against 3 per cent in 1961. Finally, the decision as from 1st January 1962, to reduce direct taxes on married women in employment and the increase, under the E.E.C. agreements, in women's wage rates to a minimum of 85 per cent of men's rates, could lead to an increase in the proportion of women in the labour force, which is comparatively small in the Netherlands. On the other hand, unemployment has fallen to a level that can scarcely be reduced.

9. The rise in industrial production from one year to the other is, however, unlikely to exceed 4 to 5 per cent, in view of the limited production possibilities. Also, in a few limited sectors (textiles and shipbuilding, for example) demand might fall short of potential supply. In the building sector, progress will continue to be very limited owing to the labour shortage (1 to 2 per cent in volume). Finally, in agriculture, the epidemic of foot and mouth disease may well prevent production from increasing by more than 2 per cent. The total rise in the gross national product, although sharper than in 1961, will probably be limited to not more than 4 per cent.

II. ADAPTATION OF DEMAND

10. In 1961, the rate of growth of demand was much lower than in 1960: internal spending increased by only 4 per cent in volume as compared with 10 per cent in 1960, while sales of goods and services abroad showed an increase of only 4 per cent as against 14 per cent in the previous year. The authorities endeavoured to adapt demand to supply without causing too great an increase in prices and to this end adopted various restrictive measures.

11. Private consumption increased in volume by 4.5 per cent, as compared with 6.5 per cent in 1960. Consumption expenditure increased far more rapidly than the national income and the rate of private saving tended to decline. To limit consumers' purchasing power, the tax reliefs planned for July 1961 were postponed and in August hire purchase regulations tightened. In fact, the volume of consumption seasonally adjusted, remained stable for a large part of 1961, but began to expand again in the last quarter of that year. This expansion should continue in 1962 under the influence of the fresh wage increases, the tax reliefs, now scheduled to come into force on 1st July 1962, and the increase in old age pensions. It will, however, be curbed by the rise in prices and by the slower increase in incomes other than wages. Private consumption should, according to the Central Planning Bureau, show a total average increase of 4 per cent between 1961 and 1962.

12. Stimulated by the labour shortage and the high level of profits achieved in previous years, gross fixed investment by industry increased in 1961, but at a slightly less rapid rate than in 1960: + 12.5 per cent in volume, as against 14.4 per cent.

This expansion has continued despite the decision taken in April 1960 to reduce the tax reliefs for investment * but the effects of this measure will probably be more apparent in 1962. In agriculture investment was intensified (+ 20 per cent in volume as compared with 13.3 per cent). Investment in the transport and communications sectors was 4 per cent lower than in 1960. Admittedly, these investments were exceptionally high in 1960 owing to purchases of jet aircraft by K.L.M. This trend may also be explained by the slump in maritime transport. The volume of house-building remained unchanged.

13. In 1962, private investment will be checked by lower profits, restrictions on credit, the decline in liquidity and the less encouraging outlook for demand in certain sectors. The need to economise on labour, on the other hand, will be a factor stimulating expansion. The rate of growth might be about the same as in 1961 or slightly lower.

14. In 1961 consumption and investment in the public sector increased at roughly the same rate as in 1960: i.e. 3 per cent and 7.5 per cent, against 3.6 and 7.0 per cent respectively. In 1962, the increase in public consumption will be a little more marked (+ 4 per cent in volume). Public investment will again increase by 8 per cent, continuing a fairly rapid rate of growth.

15. Exports of goods and services showed the smallest increase in comparison with the results achieved in 1960: 4 per cent in volume as against 14 per cent. This situation is due to the rigidity of supply, and the decline in the demand for some products (agricultural produce, chemical fertilisers and textiles). The effects of the revaluation of the florin on the volume of exports were fairly slight, as exporting firms preferred to accept a cut in their profit margins rather than increase their dollar prices. In 1962, exports will continue to be hampered by supply limitations. On the whole, the volume of exports is expected to show an increase roughly equivalent to the 1961 figure (+ 4 per cent).

III. THE PROBLEM OF INCOMES AND PRICES

16. The revision of the collective wage agreements in 1961 affected 25 per cent of the labour force: together with previous revisions, this resulted in a 3 per cent increase in the wage bill** during this year. With the wage drift, workers' earnings increased by 5 per cent as compared with 9 per cent in 1960.

* The possibility of advance amortization for all industrial equipment was reduced to 8.33 per cent per annum, as compared with 16.66 per cent previously. The deduction for investment, which amounted to as much as 8 per cent per annum, was reduced to 5 per cent per annum for two years.

** Hourly rates increased rather more, due to the reduction in working hours.

As productivity per worker increased by only 0.7 per cent (6 per cent in 1960)*, labour costs increased by 4 per cent (3 per cent in 1960). It is therefore not surprising that retail prices rose by more than 2 per cent between the last quarter of 1960 and the last quarter of 1961, despite the decline, due to the revaluation, in the prices of certain imported goods. This situation alarmed the authorities and in November a Decree was issued, valid for one year, whereby importers of consumer goods (except foodstuffs) may not exceed the gross profit margins calculated in 1958. The object was to ensure that the reduction in customs duties within the Common Market and the advantages stemming from the revaluation of the florin would be passed on to consumers in the form of reduced prices.

17. An agreement on the wages policy to be followed in 1962 was signed at the end of November between the Government and the "Labour Foundation", on which management and labour are represented. This agreement is in line with the policy hitherto adopted by the public authorities i.e. to link wage increases to the long-term increase in productivity in each branch of activity. The general trend of productivity during the current year is, however, also taken into account. The agreement defines the formula to be used to determine the margin available for raising wage rates, and improving other working conditions. The formula is:

$$\frac{3a + b}{4}$$

where "a" represents the long-term productivity increase (generally 9 years) in the branch in question, and "b" the anticipated productivity increase for the whole of the economy in 1962 (2 per cent). In this way the wage rise will be to some extent checked in industrial branches with a productivity increase of over 2 per cent, and difference in wage increases between one branch and another will be narrowed down. Moreover, the average wage increase for 1962 (a year when productivity made relatively little progress) will be lower than if account had been taken only of the productivity increase in the last nine years, when progress was generally rapid.

18. The Netherlands authorities are determined to see that the rules adopted for wage-fixing are strictly observed in 1962, particularly as a special allowance is to be added to any wage increases in respect of higher productivity so as to offset the general rise in rents scheduled for 1st July 1962. In that year the renewal of the collective agreements will affect 90 per cent of wage-earners. The Central Planning Bureau considers that the rise in earnings per industrial worker is likely to be at least 6 per cent, whereas the average increase in productivity in 1962 will probably not be more than 2 per cent. It is hoped that the

* This small increase is particularly due to the reduction in the working week. Production per man-hour seems to have increased from 3 to 4 per cent.

general rise in prices will not exceed an average of 2 per cent, 0.5 per cent of which will be accounted for by the statutory increase in rents. This result, however, will be achieved only to the extent that the wage drift is limited, that certain allowances, particularly the special payment to offset the rent increase, are actually taken out of profits (incomes other than wages are expected to increase by only 3.5 per cent in 1962) and that the prices of certain goods (agricultural produce or imports) continue to remain stable or decline.

IV. MONETARY AND FINANCIAL POLICY

19. At a time when the expansion of supply is limited by bottlenecks, the authorities are particularly concerned to avoid an unduly rapid increase in financial resources and to reduce liquidity in the economy. The decline in the rate of private saving in 1961, at a time when investment continued to show a considerable increase and the large outflow of capital were expected to lead to a contraction of available funds. Nevertheless, it was clearly necessary for the Government to maintain its policy of issuing long-term loans beyond what was strictly necessary to meet cash requirements. On the other hand, the sharp rise in credit to the private sector during the first few months of 1961 made it necessary to fix a ceiling on the expansion of credit to the economy. The increase in liquidity in the economy was slowed down and it seems now, with excess liquidity being absorbed, that the economy has entered a period in which the instruments of monetary policy will be more effective.

Public finance

20. The cash deficit* of the Central Government increased considerably in 1961, rising to fl. 1,524 million as compared with fl. 337 million in 1960 (after deducting the operations arising from the liquidation of the E.P.U.). Nevertheless, if no account is taken of expenditure which has had no direct influence on the Netherlands economy (payments to offset revalutation losses incurred by the Central Bank, credits granted through the I.M.F.), the cash deficit is no more than fl. 788 million as compared with fl. 270 million in 1960**. The two long-term Treasury loans and the deposits in the advance subscription accounts*** brought in funds which exceeded the deficit by fl. 309 million. The main increase in expenditure since 1960

* The cash deficit represents charges arising from the administration of the budget and the amortization of the long-term public debt.

** In 1961, the Netherlands made an advance repayment of fl. 189 million on its long-term foreign debt.

*** Accounts into which certain institutional investors are required to pay a proportion of their (available) funds until they can place them in Government bonds.

1) Including fl. 26 million representing interest not paid on a debt arising from the liquidation of the E.P.U. and repaid in advance.
2) Including an expenditure of fl. 557 million payable as a result of the liquidation of the E.P.U.
3) Including a payment of fl. 131 million to the International Monetary Fund to cover the increase in the Netherlands quota.
4) Including a receipt of fl. 182 million from the settlement of debts due under the liquidation of the E.P.U.
5) Including a receipt of fl. 137 " " " " " " "
6) If no account is taken of the exceptional transactions referred to in 1) to 5), the deficit amounted to fl. 319 million in 1959, fl. 337 million in 1960, and fl. 1,524 million in 1961.

SOURCE: Ministry of Finance.

has been on defence, due partly to the cessation of American aid, agricultural subsidies, and education. The authorities were unable to effectuate the reductions in income tax and corporation tax scheduled to come into force in July 1961 and January 1962 respectively.

21. The budget for 1962, as submitted in September 1961, shows an overall deficit of fl. 275 million, as compared with an expected deficit of fl. 1,547 million for 1961. The cash deficit should be about the same size as the budget deficit and the authorities consider that payments into the advance subscription accounts will be sufficient to cover it. A public loan issue of fl. 300 million was made in February 1962 with the sole aim of helping to reduce liquidity. The reduction in the deficit below the 1961 figure was due to an increase in revenue of 7 per cent and a slight decline in total expenditure. A number of expenditure items are expected to increase: defence expenditure, investment, education and civil servants' salaries *. On the other hand, subsidies to agriculture and building will be reduced, while the exceptional expenditure recorded in 1961 will not recur.

22. The reduction of income tax, which had been initially planned for 1st July 1961, and subsequently postponed, will come into force on 1st July 1962. It will involve a revenue loss of fl. 500 million annually. The tax on corporations will be maintained at the rate of 44 to 47 per cent up to 1st January 1963, and thereafter the rate will be 42 to 45 per cent, i.e. only half the reduction originally planned (40 to 43 per cent). A number of slight taxation adjustments will come into force as from 1st January 1962: tax reduction for married women in employment (fl. 50 million) and establishment of a special tax on mineral oil (fl. 65 million). These tax reliefs, introduced in 1962, will not see their full effect until 1963. The relatively substantial increase in revenue expected in 1962 is due to the rapid rise in nominal revenue and to the cut, in 1960, in the tax reliefs designed to stimulate investment.

23. Local finances developed favourably and showed a higher current surplus in 1961 than in 1960 (fl. 827 million as compared with fl. 616 million). Although the amount of long-term borrowing by local authorities declined from one year to the other, their total available resources exceeded their total capital expenditure; public works continued to expand but expenditure on housing was again cut. As a result, in 1961 the local authorities either reduced their short-term commitments or increased their reserves, as they had done in 1960.

* Civil servants will receive, as from 1st January 1962, an average salary increase of 8 per cent, varying according to grade. An allowance to offset the rent increase will be paid to them, as well as to other wage-earners, as from 1st July 1962.

Monetary policy

24. To avoid attracting short-term foreign capital the Netherlands authorities endeavoured to keep interest rates low, while the discount rate which had been fixed at 3, 5 per cent in November 1959 and remained at this level until 25th April 1962, when it was raised to 4 per cent. After the rapid expansion in credit to the private sector in the early months of 1961, negotiations were opened between the Central Bank and the commercial and agricultural banks with a view to checking this expansion by quantitative restrictions. Under an agreement of July 1961 the Central Bank fixes the normal amount of credit which may be granted to the private sector. It was at first decided to consider credit expansion of 1 per cent per month as normal but this was cut as from 1st January 1962, to 0. 5 per cent per month. When the banks exceed this limit, they are required to pay into a special non-interest-bearing account at the Central Bank an amount equal to a specific proportion of the surplus credit. In fact, the banks exceeded this limit in January 1962 and now more than fl. 100 million are frozen in the special accounts.

25. The monetary authorities change the compulsory minimum reserve rate fairly frequently. This rate was reduced in two stages, in August and October 1961, from 10 per cent to 6 per cent so that the banks should not be tempted, under pressure, to repatriate funds invested abroad. At the same time, the Central Bank granted the banks facilities on several occasions, to realise on advantageous terms their holdings of Treasury

bonds. As the tone of the market had become easier, the compulsory reserve rate was increased to 8 per cent in January 1962, but was again cut to 6 per cent on 22nd March for one month so as to help the banks to finance the subscriptions to the public loan. Similarly, the Central Bank offered to buy back Treasury bonds maturing in April or May at a rate of only 2 per cent.

26. On the capital market issues of shares and debentures by the private sector were still lower than in the previous year. Despite the decline in saving there was therefore still an ample supply of funds on the capital market and the Dutch authorities decided in April 1961 to re-open the market to foreign borrowers who floated loans totalling fl. 537 million during that year *. This outflow of funds has enabled the loan issues made by the Central government and the local authorities although still significant, to be reduced considerably below their 1960 figure. After the fl. 300 million loan floated by the Treasury in February 1962, availabilities on the money market were definitely reduced**. The authorities will decide according to the trend of availabilities, the amount of foreign issues and of public loans.

2) Including a loan of Fl. 10 million garanteed by the Government to the Netherlands Antilles.

SOURCE : Maandstatistiek van het financiewezen.

* Since 1955, no foreign issues were authorised on the capital market. The authorities feared that the comparatively low interest rates in the Netherlands would drain too great a proportion of national saving abroad. A further reason between 1958 to 1960 was the desire to enable local authorities to fund their short-term debts.

** The loan was quoted below its original issue figure as soon as it was placed on the market.

V. ECONOMIC RELATIONS WITH OTHER COUNTRIES

Balance of Trade

27. The deficit on the balance of trade (exports and imports f.o.b.) increased considerably in 1961, rising from $ 160 million to $ 395 million despite the improvement in the terms of trade due to the revaluation of the florin and the resultant fall in prices of agricultural imports. Whereas exports of goods were slowed down by the full employment of productive capacity and, to a lesser extent, by the weakness of demand, and increased in volume terms by only 2.6 per cent (13.7 per cent in 1960), imports exceeded the previous year's level by 6.7 per cent (as compared with 13.1 per cent in 1960).

28. Exports advanced mainly at the beginning of the year and thereafter remained practically stable. Exports of machinery, textiles and chemicals increased but there was a fall in exports of agricultural produce, iron, steel and tin. Exports to the E.E.C. countries (particularly Belgium and France) made further progress, but there was a decline in sales to EFTA countries, the United States and countries producing raw materials.

29. Imports of manufactured goods (mainly capital equipment) showed the highest increase, owing to the pressure of home demand and the E.E.C. reduction of customs duties, which were comparatively high for this type of merchandise. Imports showed a tendency to decline in the second half of 1961, as production slowed down and stockpiling slackened.

Balance of current payments and capital transactions

30. Invisible receipts showed a marked increase, rising from $ 423 million in 1960 to $ 534 million in 1961 The increase in receipts from services reflects the expansion in world trade, although the revaluation of the guilder affected the turnover of Dutch air and shipping lines. Owing to the further increase in the trade deficit the balance of payments surplus on current account fell from $ 316 million in 1960 to $ 142 million in 1961.

31. The balance of long-term capital transactions showed a deficit of $ 235 million as compared with a surplus of $ 31 million in 1960. This trend was largely due to the policy adopted by the authorities which again authorised the issue of foreign loans on the Netherlands market and accelerated the amortization of the long-term public debt. The total basic balance (current balance, unilateral transfers and balance of capital transactions), showed a deficit ($ 121 million)* after a surplus of $ 351 million in 1960. The deficit was partly offset by the large-scale movements of short-term capital which accompanied the revaluation of the builders. Drawings in guilders on the International Monetary Fund, particularly by the United Kingdom, were important. Following all these transactions, the official gold and foreign exchange reserves showed a decline of $ 54 million and the net short-term holdings of the banks a decline of $ 93 million.

Diagram 3

Prospects for 1962

32. Although it was expected that the current balance of payments surplus would be maintained in 1962 at approximately the same level as 1961, it now seems likely to show a further decline. The increase in imports might be slightly more pronounced than the Central Planning Bureau anticipated and the terms of trade are tending to deteriorate. The current surplus is therefore likely to fall by about $ 100 million. On the other hand, outflow of long term private capital might be on a smaller scale than in 1961. Issues of foreign securities on the Dutch capital market had not yet been resumed by the early months of 1962 and in April, it was decided to re-open the market to foreign loans, but up to a limited total of fl. 150 million.

VI. LONG-TERM ECONOMIC GROWTH IN THE NETHERLANDS

33. In the last ten years, economic expansion in the Netherlands has been rapid. The gross national product increased on average by 5 per cent per year and as the active population increased by 1.3 per cent per year, production per head of population showed an annual average increase of 3.6 per cent. These growth rates made it possible to achieve full employment in conditions of equilibrium. Internal economic tensions were avoided and the balance of current payments, except during 1956 and 1957, has generally shown a fairly substantial surplus. These results were obtained by means of a policy which exercised a strict control over wages and costs and fostered investment, while efforts were made to expand international trade on a liberal basis and to adjust demand as far as possible to supply.

34. So far, the Dutch authorities have not set any specific growth target. Nevertheless, in view of the considerable expansion in the active population and the productivity increases of about 4 per cent on average between 1950 and 1960, the achievement of the aim of full employment presupposed an average increase of about 5 per cent in the G.N.P. During the next ten years, the active population will increase even more rapidly, probably by about 1.5 per cent per annum. On the other hand, there are no further manpower reserves to be drawn upon, while in 1961 and 1962 the increase in production per head definitely slowed down: 1 to 2 per cent per annum. The growth rates have therefore fallen below the average for the period 1950 to 1960, without any reduction in demand. The relatively slow increase in productivity in 1961 and 1962 does not however appear to suggest any interruption in growth pattern or any reversion to pre-war norms. It appears in fact to be largely accidental and mostly due to the sudden introduction of the five-day week. If exact statistics of the actual hours worked were available, they would probably show an increase in production per man/hour of between 3 and 4 per cent. As working hours

should now remain stable, it can be estimated that the growth rate of G.N.P. consistent with the full employment of a greatly expanding labour force will soon be back at about 5 per cent per year and even higher. This of course depends on demand and exports being maintained at a sufficiently high level.

35. The employment of this additional labour and the achievement of the rate of growth mentioned above rests on the maintenance of a high level of productive investment. This investment will also have to be guided so as to ensure that production will increase most in sectors where demand is likely to rise most steeply. The development of the Dutch economy presupposes an increase in foreign trade, and this will depend not only on the international agreements and decisions taken in the E.E.C. but also on the ability of Dutch firms to find outlets abroad to offset the additional imports resulting from expansion. For this reason the authorities still remain firmly attached to a wage and income policy designed to avoid or at least to limit severely any increase in costs.

VII. CONCLUSIONS

36. There was a definite slackening of industrial expansion in 1961 and the increase in the gross national product was limited. This situation is not likely to recur in 1962, as it was largely accidental and mainly due to the sudden reduction in working hours. Furthermore, after the very rapid advance in 1960 and in view of the growing shortage of manpower, the economy needed a breathing-space. A greater expansion in the gross national product in 1962 than in 1961 can thus be expected.

37. In view of the slower increase in supply, the authorities were forced to follow a policy of limiting demand. For a long period, they refrained however, from raising interest rates in order to avoid attracting foreign capital and did not systematically increase the minimum reserve rates. On the contrary, they adopted a flexible attitude in this field so as not to force the banks to liquidate their assets abroad. Apart from reducing tax reliefs to encourage investment and restricting consumer credit, their policy was mainly to issue public loans in excess of the funds required to meet Treasury charges, to re-open the capital market to foreign issues and fix a ceiling on credit to the private sector.

38. Thanks to this policy the strain on the economy remained moderate. Tension was, however, reflected in a certain rise in prices, despite the revaluation of the guilder, and in a fairly substantial reduction in the current balance of payments surplus. It has not completely disappeared in 1962, for a further drop in the current balance of payments is anticipated. However, the increase in liquidity has slowed down, credit expansion is strictly controlled and the wage policy remains firm. But the Dutch economy is largely dependent on the international economic

situation and should the latter show a tendency to weaken, some adjustment would have to be made in Dutch economy policy.

39. The slowing down in the growth of productivity which took place in 1961 gave rise to various tensions in the economy due to limitations on the supply side and to increases in unit costs. It is, of course, not easy in a market economy to reconcile full employment and equilibrium with rapid and sustained productivity growth. Nevertheless, it is essential that all possible means of increasing the efficiency of the productive machine should be thoroughly re-examined, particular attention being paid to opportunities for increasing investment in productive equipment and making the labour market as flexible as possible. The official wages policy which does a great deal to preserve internal stability in an atmosphere of social harmony should also do all it can to facilitate the attraction of manpower into those sectors in which expansion is most rapid. Wage increases must also be closely related to the current needs of the economy and this does not perhaps always materialise when the increases are geared to productivity growth over a long period.

40. With its traditional dependence for its prosperity on the expansion of foreign trade, it is particularly important for the Netherlands to keep its costs and prices fully competitive with those of other countries. For the same reason, the Netherlands has a very immediate interest in the re-establishment and maintenance of payments equilibrium as between the major trading countries of the world. The Dutch authorities made a useful contribution to this end in 1961, by re-opening the capital market to foreign issues; this led to a moderate overall deficit in the Netherlands balance of payments, which could clearly be afforded. The Netherlands will no doubt wish to continue its liberal policies, and encourage other countries to follow suit. For the future prosperity of the Netherlands will significantly be affected by the extent to which, through measures of international co-operation, the market of other countries can be made open to Dutch exports, whether these take the form of the provision of services, industrial exports or the sale of agricultural products.

PRINTED IN FRANCE

ECONOMIC SURVEYS BY THE O.E.C.D.

Following the practice established since 1954 by the O.E.E.C., the O.E.C.D. is publishing annual economic surveys for each Member country, and for Yugoslavia.

Surveys will be published in the following order between November 1961 and August 1962 :

United States
Canada
Switzerland
Iceland
Germany
United Kingdom
Greece
Denmark
Ireland
Austria
Italy
Sweden
Spain
Benelux
Yugoslavia
Portugal
Norway
Turkey
France

Surveys were last issued for these countries, except Greece, Iceland and Yugoslavia, between October 1960 and September 1961.
