JULY 1969

BASIC STATISTICS OF NORWAY

THE LAND

Area (1 000 sq. km)	324
Arable area (1 000 sq. km)	10
Productive forest (1 000 sq.km.)	70
Major cities (January 1968):	
Oslo	484 300
Bergen	116 800

THE PEOPLE

Population (Jan. 1968)	3 802 000
No. of inhabitants per sq.km	12
Net natural increase annual rate (average 1960-1967)	29 500
Per 1 000 inhabitants (average 1960-1967)	8.0
Labour force total, 1967 (man years)	1 552 500
Of which, in agriculture, forestry and fishing	278 200
Net annual migration (average 1960-1967)	—15

PRODUCTION

Gross National Product in 1968 (millions of Kr. OECD definition)	64 434
GNP per head ($)	2 350
Gross fixed capital formation (1968):	
Percentage of the GNP	26
Per head, $	626

THE GOVERNMENT

Public consumption in 1968 (percentage of GNP)	18
General government current revenue in 1967 (percentage of GNP)	34
Public gross fixed capital formation in 1967 (percentage of GNP)	10
Composition of Parliament (No. of of seats):	
Labour party	68
Conservative party	31
Centre (Agrarian) party	18
Liberal party	18
Christian Democrats	13
Left-wing Socialist party	2
	150

Last general elections: 1965.

Next general election: 1969.

LIVING STANDARDS

Average hourly earnings of male industrial workers in 1968 (in kroner)	11.22
No. of passenger cars in use per 1,000 inhabitants (Dec. 1967)	150
No. of telephones per 1 000 inhabitants (Dec. 1967)	260
No. of radio licences per 1 000 inhabitants (Dec. 1967)	295
No. of television licences per 1 000 inhabitants (Dec. 1967)	174

FOREIGN TRADE

Exports:	
Exports of goods and services as a percentage of GNP (average 1960-1967)	37
Of which:	
Gross freight earnings	15
Main exports in 1967 (percentage of total commodity exports):	
Forestry products	14
Base metals and products thereof	26
Fish and fish products	9
Machinery, apparatus and transport equipment (excl. ships)	12
Imports:	
Imports of goods and services as a percentage of GNP (average 1960-1967)	38
Main imports in 1967 (percentage of total commodity imports):	
Ships (average 1960-1967)	12
Machinery, apparatus and transport equipment (excl. ships)	28
Raw materials (non-edible) incl. fuels and chemicals	22
Base metals and products thereof	12

THE CURRENCY

Monetary unit: Krone.

Currency unit per $ 7.14

OECD ECONOMIC SURVEYS

NORWAY

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The Organisation for Economic Co-operation and Development was set up under a Convention signed in Paris on 14th December 1960 by the Member countries of the Organisation for European Economic Co-operation and by Canada and the United States. This Convention provides that the OECD shall promote policies designed :

- *to achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy ;*
- *to contribute to sound economic expansion in Member as well as non-member countries in the process of economic development ;*
- *to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.*

The legal personality possessed by the Organisation for European Economic Co-operation continues in the OECD, which came into being on 30th September 1961.

The members of OECD are : Austria, Belgium, Canada, Denmark, Finland, France, the Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States.

The Socialist Federal Republic of Yugoslavia is associated in certain work of the OECD, particularly that of the Economic and Development Review Committee.

The annual review of Norway by the OECD Economic and Development Review Committee took place on 19th June 1969. The present Survey has been updated subsequently

INTRODUCTION

After five successive years of fast growth leading to increasing demand pressures, the pressure was eased in 1968 followed by some slowdown in the growth of output. The slower growth was mainly caused by a decline in business fixed investment, but was reinforced by a reduction of working hours and a failure of the winter herring catches. Some slack developed in certain industries and the labour market became less tight than earlier; nevertheless, the relatively strong rise in costs seems to have continued. The current external account improved significantly, and changed to show a large surplus for the first time in the last decade. The major part of the improvement can be ascribed to the shipping sector—higher freight earnings and a sharp fall in net imports of ships—but the trade balance (excluding ships) also improved, reflecting notably the easing of demand pressures.

The first months of 1969 have seen a recovery of domestic demand for consumer and investment goods and a faster growth of production. The authorities expect a 4 per cent increase in output from 1968 to 1969, roughly in line with the growth of capacity which also this year will be limited by the shortening of the working week. A continued strong fall in imports of ships should result in some further improvement of the current external account. But the rise in labour costs may remain strong.

The government has published a programme for the period 1970-73. Annual growth of GDP is estimated at 4.5 per cent, slightly less than the outcome for the 1960's. Merchandise exports and fixed asset formation are expected to remain the major growth factors, and the labour market is likely to remain tight. The current external account is expected to show only a small deficit, and with foreign reserves at a fairly comfortable level, the authorities do not envisage further long-term borrowing of any considerable size. A comprehensive tax reform, with some change in emphasis from direct to indirect taxation, is approved by Parliament and will become effective as from 1st January 1970.

I RECENT TRENDS

Demand

In 1968 the gross domestic product increased by 3.8 per cent in real terms, somewhat less than earlier; in the five-year period 1963-1967 the annual rate of growth had averaged 5.2 per cent, culminating with 5.8 per cent in 1967. During the last two years production trends have differed appreciably from the general pattern in Western Europe; in 1967 the rise in output was faster, and in 1968 weaker, than in OECD-Europe.

The slowdown in the growth of output in 1968 may be traced to factors both on the production and the demand side. Production in the fisheries and some related industries fell due to small herring catches, and output in forestry was reduced owing to lower timber prices. The lower production in these primary industries may have reduced the growth rate of total output by about one-half of one percentage point. Moreover, a reduction of the contractual working week as from 1st July 1968, may have reduced the growth rate by another half of one percentage point. However, the main reason for the slower growth—and a new feature in the economic situation—was the fact that the strong upward trend in fixed asset formation was reversed.

Table 1 **Supply and Use of Resources**

1 Per cent of GDP.
Sources : Economic Survey, 1968, and Revised National Budget for 1969.

Tables 1 and 2 show that gross fixed asset formation in 1968 fell by 8.6 per cent in volume. Much of the decline was related to investment in ships and boats, which have little impact on domestic activity. Other business investment fell by 3.6 per cent following an increase of 6.8 per cent in the preceding year. Investment in mining and manufacturing decreased by 9.4 per cent and in electricity supply by 3.3 per cent, whereas investment in agriculture, transportation (excluding shipping) and several service sectors rose rather fast. The weakening of industrial investment demand had been felt already towards the end of 1967, partly reflecting the termination of several large industrial projects. But other factors contributed. Profit margins have narrowed because of increased social premiums after the introduction of the National Insurance Scheme from 1st January 1967, and profitability in certain sectors may have been reduced because of stronger international competition. Moreover, there may have been difficulties in financing certain industrial investment projects over the bond market. Nevertheless, industrial investment in 1968 was higher than in 1966 and still rather high by international standards. Public investment and investment in residential construction also rose more slowly in 1968 than in the preceding year. Investment in ships usually shows large variations from one year to another. The marked decline in 1968 was due to the exceptionally few orders placed in 1966 and 1967 and to large exports of old and less profitable ships.

Table 3 **Analysis of the Growth of GDP**

Changes in volume (1961 prices) from previous year in per cent of GDP, including estimated multiplier effects

	1966	1967	1968
Autonomous demand components	3.5	1.6	1.7
Export of goods excluding ships	1.8	1.4	2.6
Business investments excluding ships	1.6	0.9	—0.5
Inventory accumulation	0.1	—0.7	—0.4
Policy-determined demand components	1.0	3.0	1.6
Central government expenditure on goods and services	0.4	0.7	0.7
Local government expenditure on goods and services	0.2	1.3	0.7
Investment in dwellings	0.4	1.0	0.2
Direct contribution from the shipping sector	0.9	1.2	1.0
Residual[1]	—1.0	—	—0.5
Actual change in GDP	4.4	5.8	3.8

1 Actual change in GDP less the total estimated impact of autonomous and policy-determined components and direct contribution from the shipping sector. The residual may partly be ascribed to short-term irregularities in the propensity to consume and import.

Source : Secretariat estimates.

Table 1 shows that public and private consumption also rose less fast in 1968 than in the previous year, and stockbuilding was weaker. Total domestic demand declined by 1.5 per cent in volume; excluding investment in ships, domestic demand rose somewhat (2.1 per cent) but much more slowly than the growth in output.

Exports of goods and services, increasing by more than 10 per cent in real terms, constituted the main expansionary demand element in 1968. There was a particularly sharp increase in merchandise exports (excluding ships) (12.4 per cent in volume). Exports of shipping services remained strong (7.6 per cent) following the record rise of more than 10 per cent in the year before. The advance in exports of other services was more moderate (5 per cent). The large increase in ship exports was mainly composed of second-hand tonnage, but deliveries to abroad of new ships also rose somewhat from the high level reached in 1967.

The breakdown of demand components in Table 3 is similar to that shown in last year's economic survey of Norway (Table 2). It distinguishes between autonomous demand components (merchandise exports excluding ships, business investment excluding ships and stockbuilding) and policy-determined components (public expenditure on goods and services and residential construction). The estimated impact on domestic activity of changes in these components given in Table 3 takes account of secondary

("multiplier") effects on private incomes and consumption[1]. The table also distinguishes the direct contribution to GDP of the shipping sector.

It can be seen from Table 3 that autonomous demand components, taken together, exerted about the same expansionary impact in 1967 and 1968. The negative swing in the effect of business investment of 1.4 per cent of GDP was almost offset by the effect of higher merchandise exports. If the effect of merchandise exports and the direct contribution of the shipping sector are taken together (more than 90 per cent of shipping services are exported), it may be said that the increase in the volume of exports of goods and services directly and indirectly accounted for almost the entire rise in GDP in 1968.

The expansionary effects of policy-determined demand components seem to have been almost halved from 1967 to 1968. Purchases of goods and services by local authorities rose rather less than in the previous year, and the expansionary impact resulting from residential construction was modest in relation to the very strong increase in this type of investment in 1967. Central government expenditure on goods and services may have given approximately the same expansionary impulses both in 1967 and 1968.

Private consumption increased by 3.6 per cent in 1968, 1.2 percentage points less than in the year before, but in line with the rise in real disposable incomes. Food consumption rose at the same rate as total consumption after several years with a relative decrease, whereas purchases of clothing and certain durables rose less fast than earlier.

Production and Employment

After many years of stability, production in agriculture rose by 1.5 per cent in volume in 1968, mainly due to a good harvest. Output in the fisheries fell by 10 per cent following a record level in 1967 and considerable increases also in earlier years. As already mentioned, the lower production was related to a sharp fall in herring catches. Lower timber fellings in the 1967/68 season resulted in a fall in output in forestry of about 5 ½ per cent. The rise in industrial production—usually stronger than in the rest of the economy—weakened already in 1967 and was modest in 1968 (2.7 per cent). Seasonally adjusted, industrial production remained virtually unchanged during 1968, reflecting the weakening of domestic final demand, lower stock-building, and a smaller supply of raw materials from the fisheries. The export industries were almost the only expanding branches; the expansion was facilitated by the existence of some unused capacity at the beginning

1 The size of the multipliers—estimated on the basis of input-output statistics—varies between 0.8 and 1.4 depending on the type of demand.

Table 4 **Production and Employment by Sectors**

Percentage increase from previous years

of the year and large capacity extensions during the year as new plants were brought into production. With the levelling off of investment activity, output in the building and construction sector rose by less than 1 per cent following the 10 ½ per cent rise recorded in 1967. Most service sectors also showed a smaller advance in output than in the previous year.

The number of wage and salary earners increased by 11 000 or 1 per cent in 1968, but as the number of self-employed fell by 7 700, total employment increased by only 3 300 or 0.2 per cent against 1.1 per cent in the preceding year and 0.7 per cent per year in the period 1960-1967. Agriculture, forestry and fishing released 4 per cent of their labour force in 1968, and there was a significant decline in employment in industry, building and construction also. The increase in employment therefore took place mainly in the service industries.

With the slow rise in employment the labour market in 1968 was less strained than earlier, and unemployment rose in the course of the year. The relation between the number of vacancies and the number of applicants fell from 0.86 in 1967 to 0.76 in 1968, and average unemployment amounted to 1.1 per cent of the labour force compared to about 0.7 per cent in the two preceding years. However, unemployment was still low by international standards, and there were shortages of labour in the most industrialised areas, whereas unemployment was significant in the less developed parts of the country, notably in the winter. The cut in the contractual working

week by 5.5 per cent (from 45 to 42.5 hours) as from 1st July 1968 helped to sustain the number of employed both in industry and the building and construction sector.

Incomes and Prices

Table 5 shows that total factor income rose rather less in 1968 than in the two preceding years, reflecting the slower advance in output—partly due to the cut in the working week—and some deterioration in the external terms of trade for goods and services. The slowdown concerned the wage bill (including social premiums, fringe benefits, etc.). Non-wage income rose somewhat faster than earlier, reflecting a better trend in the "sheltered" industries, notably trade, building and construction, electricity supply and transportation. Entrepreneurial income in forestry and fishing fell sharply owing to the decline in production, and there was no increase in non-wage income in other industries classified as exposed to foreign competition, although incomes in the shipping industry which is included in this group seem to have risen rather fast. This suggests that profits in the export industries deteriorated in 1968.

A two-year wage settlement covering most wage and salary earners was concluded in the summer of 1968. For workers in industry and handi-

Table 5 **Development and Distribution of Factor Incomes**

	Percentage increase from previous year			Percentage distribution		
	1966	1967	1968	1966	1967	1968

Total factor income	8.3	9.9	7.3	100.0	100.0	100.0

1 Exposed industries are those which are considered by the authorities as exposed to foreign competition, i.e. forestry, fishing, whaling, mining, maritime transport, air transport and manufacturing industries working on export markets or under competition from imported goods.

Source : Revised National Budget 1969.

craft, hourly earnings were increased on average by 4.4 per cent as compensation for the reduction in the contractual working week from July, and by 1.8 per cent from mid-May because of special adjustments in certain branches and low wage groups. Moreover, a general increase of 2 per cent was effected from 1st January 1969. The agreement includes a price escalator clause according to which wages will be adjusted if the new consumer price index introduced from the beginning of 1969 (with basis 1968) shows a change of 5 per cent or more from the January 1969 level. According to present prospects for prices, there is little likelihood that this clause will come into effect. Most salary earners in private enterprises and public servants obtained income increases of about 7 per cent from May 1968 and a further increase of 2 per cent from January 1969.

Table 6 **Development of Wages**
Percentage increase from previous year

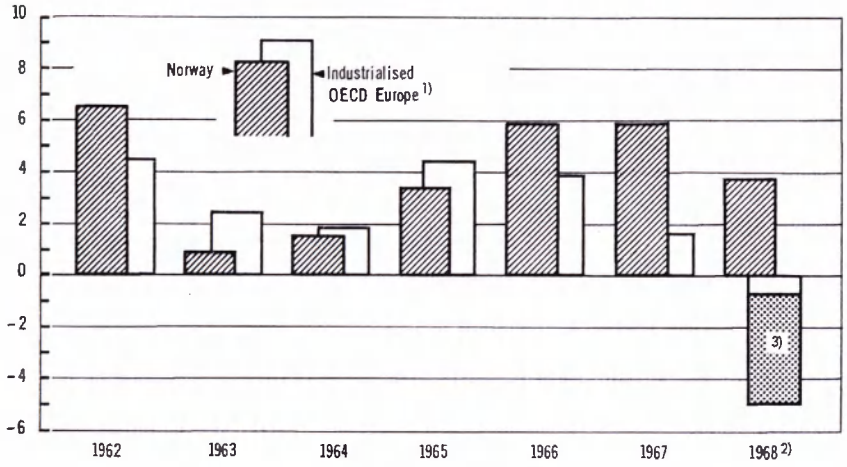
	Average wages per man year[1]	Price index for private consumption[2]	Real wages per man year	Average hourly earnings in mining and manufacturing[3]
1965	8.0	3.9	3.9	9.5
1966	8.7	3.5	5.0	7.4
1967	8.6	4.3	4.1	8.0
1968	6.2	3.5	2.6	8.2

1 Excluding premiums to social security paid by the entrepreneurs.
2 Price index for private consumption in the national accounts.
3 Weighted average for men and women.
Source : Revised National Budget for 1969.

Table 6 shows that the wage agreements together with wage drift resulted in an increase in wages and salaries per man year of 6.2 per cent on average from 1967 to 1968. The real increase per man year was only 2.6 per cent, considerably less than earlier, whereas the real increase in hourly earnings is estimated at 4.5 per cent, in line with recent trends. In mining and manufacturing hourly earnings rose somewhat faster than in the two previous years both in nominal and real terms, but with a stronger increase in productivity the rise in unit labour costs slowed down. Diagram 1 shows the relative labour unit cost development in Norway and OECD-Europe for each of the years 1962-1968. It is seen that the development has been unfavourable for Norway during the last three years, in particular in 1968 when devaluations accounted for about half of the relative deterioration of Norway's cost position.

The rise in prices slowed down somewhat in 1968, mainly due to lower import prices. During the year the consumer price index rose by 3.7 per cent compared to an average annual increase of 4.2 per cent in the preceding 5-year period. The new consumer price index (1968 = 100) based on recent household expenditure data, shows an increase of only 3 per cent from February 1968 to February 1969.

Diagram 1 **Trends in Unit Labour Cost**
Manufacturing, percentage change from previous year



1 Industrialised OECD countries in Europe weighed together according to their estimated importance for Norwegian foreign trade.
2 Preliminary estimates.
3 Effect of the devaluation of Sterling and the Danish Krone.

Source: OECD Secretariat.

NOTE Unit labour cost is defined as the total cost of wages, salaries and associated employer outlay per unit of output in the manufacturing sector. For the purpose of international comparison national data have been converted to dollars at current exchange rates. A devaluation consequently is registered as a reduction in unit labour cost. The comparability and the precision of the indicators utilised may not in all cases be completely satisfactory and the estimates should therefore be considered as a crude measure of trends.

Balance of Payments

The current external account improved from a deficit of $203 million in 1967 to a surplus of $165 million in 1968, a swing representing about 4 per cent of GDP. The improvement was mainly due to a sharp rise in the surplus of the shipping sector, but a lower deficit on the trade balance (excluding ships) and a better performance on the balance of services and trans-

fers (excluding shipping) also contributed. As capital imports fell—both of the shipping sector and other sectors—the overall balance of payments nevertheless changed little between 1967 and 1968.

The current external surplus of the shipping sector increased by $293 million to $643 million in 1968. Net freight earnings rose by $99 million or 12 per cent, partly reflecting a 7 per cent increase in the tonnage of the merchant fleet and partly higher freight rates. Net imports of ships—on the other hand—fell by $199 million, as there was both a sharp decline in imports of new ships and a rise in exports of second-hand ships. Net borrowing abroad related to ship imports fell correspondingly, so that the overall balance of the shipping sector improved by only $86 million, almost in line with the rise in net freight earnings (see Table 7).

1 Second-hand ships.

Source : Revised National Budget for 1969.

Merchandise exports excluding ships rose by 9 per cent in value in 1968, rather more than in the previous year, reflecting better market conditions abroad and a higher capacity utilisation in the export industries. The increase was particularly strong for exports of aluminium (37.8 per cent) due to the expansion of productive capacity in that sector. Exports of iron and steel, paper and paper products and chemicals also rose significantly. Exports of fish and fish products (including fish oils and meal) fell sharply because of the small herring catches. The rise in exports of highly-processed goods slowed down to only about 7 per cent following increases of 16 and 12 per cent in 1966 and 1967 respectively. The weaker trend in these exports contrasts sharply with the strong acceleration in the growth of OECD countries' imports, but may be related to the rather slow growth of imports

in other nordic countries, notably Denmark and Sweden, which weigh heavily in Norway's exports.

The rise in merchandise imports (excluding ships) slowed down to only 4.3 per cent in value in 1968, reflecting the weaker trends in domestic demand and production. Imports of investment goods fell, whereas imports of consumer goods and raw materials rose, but less fast than in 1967 (see Table 9).

With these trends in merchandise exports and imports, the trade balance (excluding ships) improved by $49 million. Tourist earnings stagnated in 1968, partly a result of restrictions on tourist allowances in other Member countries, while there was a further increase on the expenditure side. However, the net surplus on the balance of services showed a rise of $16 million and the deficit on net transfer payments (both excluding shipping) declined by $10 million; the latter movement reflected higher interest earnings on the foreign exchange holdings. Excluding the shipping sector, the current account in 1968 showed a deficit of $478 million, representing an improvement of $75 million compared to the previous year.

Prices on commodity exports fell by 3 per cent from 1967 to 1968, and import prices declined somewhat less, implying that the volume changes of

exports and imports were significantly higher than the value changes referred to above. The terms of trade for total exports of goods and services may have deteriorated by 1 per cent.

Net borrowing abroad by sectors other than shipping was also significantly reduced in 1968, in line with the target in the national budget. Capital imports excluding the shipping sector declined by $158 million, and with net borrowing by the shipping sector at the same time falling by $208 million, the decline in total capital imports roughly corresponded to the improvement on the current account. The overall balance therefore changed little. But contrary to developments in 1967, the rise in the foreign exchange reserves of $214 million in 1968 mainly took place in the private sector, notably commercial banks; official reserves (including the IMF position) rose by only $25 million. At the end of 1968, total official and private foreign exchange reserves corresponded to more than 6 months of merchandise imports.

II ECONOMIC POLICY

The strong expansion in Norway during 1966 and 1967 led to some strain on resources and was accompanied by a rather fast rise in costs and the current external deficit. A better performance therefore seemed desirable in 1968. With the shortening of the working week from mid-1968 the physical scope for expansion was reduced at the same time as prospects pointed to stronger foreign demand. Economic policy was therefore designed to restrict the growth of domestic demand in 1968. However, following the decline in business fixed investment, certain stimulative measures were taken towards the end of the year.

Fiscal Policy

The budget as originally voted for 1968 restricted the growth of current and investment expenditure to 9 per cent in value against 10.7 per cent in the preceding year. As in 1967 appropriations were increased most strongly for communications, education and research, and social transfers. But since additional appropriations were voted in the course of the year, the rise in actual expenditure was somewhat higher than originally envisaged: 10.5 per cent for total expenditure and 7.6 per cent for goods and services. Thus, including investment in government-owned enterprises, total central government expenditure on goods and services may have exerted about the same stimulative impact as in 1967 (Table 3). Direct taxes were reduced somewhat to modify the progressivity of tax rates, the revenue loss amounting to Kr. 125 million. Moreover, the full effect of certain tax cuts voted in 1967, inter alia to stimulate personal and company savings, may have served to reduce revenue by about Kr. 150 million. But from 1st January 1968 the general sales tax was extended to cover dwellings. As a system of compensating transfers from the government was introduced for dwellings up to a certain size, the tax will discourage the building of big and expensive houses and apartments; the net revenue increase in 1968 is estimated at Kr. 200 million. With a slower growth of the tax base, total revenue increased significantly less than in the previous year, and the financial surplus fell by about Kr. 300 million (0.4 per cent of GDP).

The budget voted for 1969 is somewhat more expansionary than the 1968 budget. Measured in current prices, expenditure on goods and services should increase by about 8 per cent, slightly more than in 1968. Transfer expenditure, however, will rise particularly fast; by 15.9 per cent compared with the previous budget. A further reduction in direct tax rates may cost Kr. 140 million, but the revenue loss will partly be offset by increases in indirect taxation estimated to yield Kr. 100 million. Current revenue is

estimated to increase by about 10 per cent; faster than in 1968. As actual spending normally falls short of appropriations, it is likely that the financial surplus will be higher than in 1968. The surplus may amount to Kr. 300 million whereas the budget (Table 11) shows a deficit of Kr. 92 million.

Net financial savings in the social insurance system have increased strongly in recent years, mainly due to the establishment of the National Insurance Scheme from 1st January 1967. The scheme is accumulating large funds and is already an important source of credit. Net financial savings in the social insurance system rose from Kr. 300 million in 1966 to Kr. 930 million in 1967 and Kr. 950 million in 1968—about 1.3 per cent of GDP in the latter year. Although the National Insurance Scheme may have had an adverse effect on other forms of financial savings, the figures indicate that increased payments to social insurance have exerted a rather strong deflationary impact on the economy during the last two years. In 1969, net financial savings in the social insurance system are expected to fall to about Kr. 800 million. If loan transactions are omitted, the government's overall budget policy, including the operations of the National Insurance Scheme, in the present year may have a rather neutral effect on internal demand.

Monetary Policy and Developments

The total credit supply from domestic sources increased by almost Kr. 700 million from 1967 to 1968, about in line with the target set forth in

the National Budget (Table 12). Net private and local government borrowing abroad was originally estimated at about Kr. 1 billion (Kr. 1.6 billion less than in 1967), of which Kr. 400 million by shipping companies. However, as a consequence of high earnings and large sales of second-hand ships the shipping companies were able to reduce their borrowing significantly and to make large deposits with foreign banks, increasing their net foreign financial assets by about Kr. 450 million. Other private and local government net borrowing abroad amounted to Kr. 570 million, approximately as planned. Although total credits thus increased considerably less than foreseen, the credit expansion probably contributed as originally envisaged to the growth of domestic demand, because there was a shift to more self-financing in the shipping sector and because this sector's borrowing mainly affects imports.

To regulate lending from commercial and savings banks the authorities in 1968 relied only on minimum reserve requirements which were kept unchanged during the year. The increase in bank lending was moderate in the first half, but expanded faster in the second. For the year as a whole and for commercial and savings banks taken together, total lending rose about in line with the target. As in earlier years, lending from life insurance companies was regulated by an agreement according to which the companies undertook to increase their holdings of domestic bonds by certain amounts.

The volume of bond issues increased by more than 50 per cent from 1967 to 1968 (from Kr. 2.1 billion to Kr. 3.2 billion). Sales of government bonds rose particularly fast, to a large extent because a short-term government loan from the National Insurance Scheme of Kr. 572 million (dating from 1967) was converted into long-term bonds. But the issue of bonds by other sectors was also considerably higher than in the previous year, partly because the targets for the gross volume of funds raised in the capital market by private enterprises was increased somewhat towards the end of the year in order to stimulate business fixed investment. The strong increase in the volume of bond issues was made possible without too much strain on the market, mainly because of the participation of the National Insurance Scheme which purchased more than a third of the new bonds floated in 1968, mostly government bonds. However, some difficulties in raising funds on the capital market were felt by private companies, probably reflecting the fact that the difference in interest rates between Norway and other European countries widened significantly during 1968.

The central government's financial transactions resulted in a moderate supply of primary liquidity[1] (Kr. 100 million) in 1968, compared with a withdrawal of almost 1 billion in the previous year (Table 13). The turnaround was due to a fall in net financial savings in the budget, higher government lending to the State banks and a sharp fall in short-term borrowing (strongly influenced by the conversion of the short-term loan from the National Insurance Scheme). But the change in the central government's position was to a large extent offset by a decline in the supply of liquidity resulting from Central Bank transactions mainly because its purchases of foreign currencies were much smaller than in 1968. The total supply of primary liquidity in 1968 was therefore only Kr. 90 million higher than in the previous year. The liquidity supply was influenced by a release of tax free investment funds blocked in the Central Bank; about Kr. 200 million (around 2 per cent of business fixed investment, excluding shipping) were released in November, and should be spent on investments undertaken before the end of 1969. The release contributed to a net supply of liquidity from investment funds of Kr. 26 million in 1968 compared with a withdrawal of about Kr. 100 million in each of the four preceding years.

The banks' liquidity position improved markedly last year. Bank deposits rose unusually fast (by Kr. 3.4 billion compared with Kr. 2.4 billion in 1967), whereas bank lending did not expand much more than in the previous year. Partly because yields on domestic long-term bonds were lower than the interest rates on short-term deposits abroad, and partly because

Source : Revised National Budget for 1969.

deposits with the banks were denominated in foreign currencies, most of the banks' liquidity surplus was deposited with foreign banks. The banks thus improved their foreign net position by more than Kr. 800 million, and they were also able to increase their net claims on the Central Bank. The authorities have, however, expressed their intention of maintaining the present interest rate policy.

In 1969 the authorities are aiming at a total credit supply of Kr. 6.7 billion or approximately the same amount as last year. It is expected that there will be a net outflow of capital from the shipping sector of Kr. 600 million, even more than in 1968, because of debt redemptions and credits granted in connection with exports of second-hand ships. Given the tighter foreign credit markets and the relatively large Norwegian holdings of foreign currency, private and local government borrowing abroad (excluding the shipping sector) will be somewhat more restricted than in the year before. All in all there might therefore be a net outflow of capital from the private sector in 1969 (see Table 12). The target for the supply of credit from domestic sources is about Kr. 6.8 billion or Kr. 200 million higher than the outcome for last year. The official plans suggest that credits should expand most strongly from the State banks, notably the Housing Bank, reflecting the authorities' policies to stimulate housebuilding. The volume of bond issues will also be expanded, partly to compensate for less borrowing in

foreign markets. Lending from the private banks should not expand more than in 1968, and will be regulated by the continued use of minimum reserve requirements. As in 1968, direct lending from the life insurance companies is influenced by an agreement concerning their investments in domestic bonds. It is the authorities' intention to restrict credit expansion from insurance companies and some other domestic sources.

With higher demand for credits, and given the comfortable liquidity position of the commercial banks, their lending expanded rather faster than envisaged by the authorities during the first months of 1969. From 1st June and 1st July 1969 the minimum reserve requirements of the commercial banks were therefore increased by 1 percentage point from 9 to 11 per cent, corresponding in total to about Kr. 400 million.

The Tax Reform

The Parliament has recently made comprehensive changes in the taxation system which will take effect as from 1st January 1970. The main features are:

(*a*) A reduction in direct taxes on income and property of persons and companies amounting to about Kr. 1 600 million on an annual basis;

(*b*) An increase in children's allowances, old age pensions and other transfers amounting to Kr. 1 100 to 1 200 million per year;

(*c*) An increase of indirect taxes corresponding to about Kr. 3 000 million (of which almost Kr. 600 million on public expenditure). The present turnover tax will be replaced by a value-added tax.

The reform should favour persons both in the higher and lower income brackets and will result in some reduction in central government net income, at least in a transitory period.

The government has considered it desirable to reduce direct taxation on personal income over a wide range of the income scale, notably by reducing the progressivity of tax rates; at present, this is very steep, and maximum rates are applied at a much earlier stage than in other countries. It is thought likely that the present high marginal tax rates are encouraging actions by the taxpayers which may give rise to a misallocation of resources. A large number of taxpayers with low incomes in relation to the number of dependents are also subject to a rather heavy tax burden, although they are not hit by progressive tax rates; these income groups will benefit in particular from a reduction in local government taxes. Moreover, to promote stronger equity formation in enterprises and to improve their international competitive position, direct taxation of companies will be reduced. All in all, the

revenue from direct taxes would be reduced by about Kr. 1 600 million or by 15 per cent in 1970 compared with what it would have been according to 1969 tax rules; of the reduction about Kr. 250 million will fall on companies.

The government has proposed an increase in indirect taxes of about Kr. 3 billion in 1970, compared with the revenue that would have accrued if the present tax rules had been maintained. The present retail sales tax (12 per cent of the retail price including the tax, or 13.64 per cent excluding the tax) will be replaced by a value-added tax of 20 per cent. The value-added tax has been chosen because it is considered that the retail sales tax would be less applicable at a much higher rate than the present one; there would inter alia be significant control problems. Moreover, it has been found desirable to bring the tax system more into conformity with that of other European countries. The proposed value-added tax will cover a bigger share of private consumption (about 72 per cent) than the existing retail sales tax (65 per cent). However, the value-added tax will exclude investment, whereas the present retail sales tax is imposed also on most investment goods. As it has been found necessary to maintain the total revenue from taxes on investment goods, a special tax of 12.5 per cent will be imposed on private and public investment and also on certain business input goods not hitherto taxed. In total the burden of indirect taxation on enterprises may be somewhat increased.

1 Only revenue from taxes which will be changed is specified.
Source : Proposal to Parliament (Ot. prp. nr. 17-1968/69).

Table 14 shows how the tax reform will affect public income: The additional Kr. 3 billion from the value-added tax will increase total indirect taxes by almost 30 per cent, the main part or Kr. 1.9 billion falling on private consumption, with an estimated increase in consumer prices of approximately 5.8 per cent. As the resulting cut in real incomes which for several income groups will not fully be offset by the reduction in direct taxation, social benefits in the form of children's allowances, old age allowances and rent allowances will be increased by Kr. 1.2 billion. In total the reform should result in a rise in real disposable income both for the lower and the higher income groups, in the latter case because the reduction in direct taxation will be substantial. According to the Norwegian authorities, real disposable income for most persons with medium income should be little affected. In that case the price rise resulting from higher indirect taxation should not justify a demand for increases in wages and salaries.

Source : Proposal to Parliament (Ot. prp. nr. 17-1968/69).

Table 15 shows the effects on public revenue and expenditure. It is estimated that the net effect will be a fall in public disposable income of Kr. 330 million on an annual basis. This decline in public income will entirely be on account of the central government, as the fall in local government net income will be offset by transfers from the central government. At present, indirect taxes account for three-fourths of central

government tax receipts; this share will be brought up to almost 90 per cent. For the public sector as a whole indirect taxes should account for almost 60 per cent of total tax receipts in 1970. In 1969 the public sector's gross revenue from taxes, social insurance premiums, etc., may amount to 34.5 per cent of GDP; due to the tax reform this share should rise to 35 per cent in 1970. However, if the increases in public expenditure on additional transfers and indirect taxes on investment and consumption are deducted, total taxes as a share of GDP should go down to around 33 per cent.

III PROSPECTS

1969 — Trends and Prospects

In the first months of 1969 most indicators seem to point to a strengthening of the expansion of activity. Merchandise exports have continued to rise fast, and domestic demand for consumer and investment goods seems to have recovered. The flow of industrial orders, in particular from the home market, has increased strongly. The index of industrial production, relatively flat during the second half of 1968, rose by around 10 pei cent at a seasonally adjusted annual rate from the fourth quarter of 1968 to the first quarter of 1969. The labour market seems to have become tighter. Merchandise imports rose strongly in March and April following a moderate increase in the first two months of the year, but the current external account continued to improve, mainly reflecting low ship imports.

The cut in the working week in July 1968 seems to have reduced the growth of capacity to around 4 per cent in that year. As the reduction in working hours will have their full effect in 1969, the growth of capacity in the present year may also be limited to about 4 per cent.

According to the revised national budget published in April, the authorities expect merchandise exports to remain the most dynamic demand element in 1969. Commodity exports (excluding ships) are forecast to increase by about 12.5 per cent in value, somewhat faster than last year. However, as export prices on average are thought likely to rise by 2.5 per cent, whereas they declined by 3 per cent last year, the volume increase of exports should slow down somewhat. The export forecast is based inter alia on the assumption of a 9 per cent rise in OECD imports. The most recent estimates by the OECD Secretariat suggest that OECD trade may increase by more than 11 per cent between 1968 and 1969, with some acceleration in the second half of the year. In the period January-April, Norwegian commodity exports were 13.8 per cent above the year-ago level. Both the recent OECD estimates for foreign trade and the developments of

exports in the first months of 1969 thus point to the possibility of a faster rise in commodity exports than forecast in the revised national budget.

Domestic demand is expected to increase by around 2 per cent in real terms in 1969 following the decline last year. The latest investment survey (taken in March) seems to indicate that the period of weak business investment demand has come to an end. According to the survey, investment plans have been adjusted upwards more than usual at this time of the year. Industrial investment—which fell significantly in 1968—is expected to fall slightly also this year, but the decline may have taken place already in the first quarter, and investment in mining and manufacturing is assumed to be on a moderately rising trend during the remainder of 1969. Fixed investment in most other business sectors is estimated to increase slightly faster than in the previous year. The growth rate of public investment is assumed to slow down to around 5 per cent, whereas residential con-

struction is expected to recover rather strongly and increase by 6 to 7 per cent, twice the rate experienced last year. The forecasts imply an increase in fixed investment of about 4 per cent in building and construction and of about 3 per cent in machinery and equipment (excluding ships). Investment in ships is likely to show a further decline, reflecting the low volume of orders placed in 1966 and 1967. On the basis of information about deliveries, the authorities have estimated that investment in ships may fall by about 30 per cent, but the decline should only affect imports. Following two years of decline, inventories are assumed to remain unchanged in 1969, so that the change in inventory investment should cease to represent a deflationarv factor.

There will be wage revisions only in the retail and wholesale sectors in 1969. Given the outcome of the wage negotiations last year and assuming a normal wage drift (around 3 per cent), hourly wages in industry and handicraft should rise by about 8 per cent from 1968 to 1969. The increase in nominal incomes for salary earners should be somewhat smaller. The reduction of the working week will limit the growth of the wage bill to the same extent as in 1968, but a stronger rise in employment may have an opposite effect. Transfers from the public sector to consumers is likely to increase at the same rate as in the previous year. Consumer prices may well rise by about 3.5 per cent, so that the rise in real income should be moderate. On these assumptions private consumption is estimated to increase by 3.5 to 4 per cent in real terms. However, this estimate does not take into account the probable effects on private consumption of the proposed changes in taxation as from lst January, 1970. It is very possible that consumers' spending will rise rather fast in the second half of the year, in anticipation of the strong increase in indirect taxation. Public consumption is expected to increase by 5 per cent in 1969.

On the basis of the assumptions given above concerning the various demand components, the authorities expect some acceleration in the rise in commodity imports and an increase in real GDP of about 4 per cent, by and large in line with the estimated increase in productive potential. Production in manufacturing is expected to rise by 5.5 per cent, with some acceleration during the year, entailing both higher capacity utilisation and increased employment. As already noted, the export estimate may be on the low side and consumer demand could accelerate in the second half of 1969. It is therefore possible that demand pressures could become rather strong towards the end of the year, and policy will have to remain flexible.

The authorities expect some increase in the current external surplus in 1969, reflecting a further strong decline in imports of ships. As commodity imports (excluding ships) should rise somewhat more in value than commodity exports, the deficit on the trade balance is assumed to deteriorate slightly

(by $25 to 30 million). The development of freight rates is uncertain, but assuming an 8 per cent decline from 1968 to 1969, the authorities envisage a decline in net shipping earnings of around $100 million, which however should be more than outweighed by the considerable reduction in imports of ships. Net receipts on tourism and other services are expected to increase slightly. On this basis the current external account should improve by $15 to 20 million, and show a surplus of around $180 million in 1969. There should be a net outflow of capital from the shipping sector, and net foreign borrowing by other private sectors will probably be further reduced; nonetheless the holdings of foreign exchange reserves may increase.

In 1970, the reduction in working hours will not have any limiting effect on the growth of capacity which then may be stronger than in the two preceding years. Assuming a further strong rise in world trade, exports should remain an important expansionary element. Industrial investment is expected to recover from the relatively low level in 1968 and 1969, and the authorities have assumed that there will be a rather strong increase in residential construction. The general demand picture may therefore be stronger than in 1969. The current external account is likely to turn into deficit in 1970 because of a strong recovery of ship imports.

The Long-Term Programme 1970-1973

The Outcome of the 1966-1969 Programme

In the revised national budget for 1969 recently submitted to Parliament, the government also gave an estimate of the outcome for the four-year programme 1966-1969. The developments of output and demand seem to have been well in line with the programme (see Table 17).

The growth of GNP, a little more than 4 ½ per cent annually, has been roughly as envisaged, implying that the 50 per cent target for the 1960's suggested by the OECD will be somewhat exceeded as far as Norway is concerned. Production by industrial sectors has also conformed well with the programme, except for a smaller rise in the volume of shipping services than expected. This was due to the large exports of small and less competitive ships undertaken in the last two years, entailing a slower rise in the merchant fleet; this also explains most of the discrepancy between the expected and the realised development of fixed investment. Apart from shipping, fixed investment fell short of the programme only in mining and manufacturing.

The balance of payments was much stronger than envisaged. As a result of unexpectedly favourable freight rates, shipping earnings were much

higher than forecast. This, together with large sales of old ships, produced a balance on the current account for the period as a whole, against an expected deficit of about $120 million a year. The improvement of the current account, together with continued long-term borrowing abroad, led to a considerable strengthening of the exchange reserves.

Growth in 1970-1973

The programme for the coming four years is, like its predecessors, partly a forecast (foreign trade, business investment) and partly a programme (public expenditure, residential construction, investment in transport facilities and power plants). Assuming a continuation of steady growth in Western Europe and North America and aiming at an approximate equilibrium position of current external account, the annual advance in real output is estimated at 4 ½ per cent, slightly less than the outcome for the 1960's.

The programme does not envisage any major changes in past trends in individual sectors. Agricultural production may remain stagnant, as in the past 25 years. Production in the fisheries is likely to fall from the high level in recent years with exceptionally good catches. As in other industrialised countries, the growth of production in the service sectors (excluding shipping) is expected to accelerate. The advance in mining and manufacturing, estimated at about 4 ½ per cent annually, may be slightly lower than in the 1960's. Lower growth rates are envisaged also for power production, and for the shipping sector.

Fixed investment, notably in manufacturing, is expected to remain a major growth factor. Excluding shipping, the growth of fixed investment

should accelerate and exceed that of GNP as in most branches the further advance of production depends upon the growth of physical capacity, but the past trend of a gradual diversification of industrial output from capital-intensive to more labour-intensive production will continue. In shipping, however, fixed investment is estimated to fall further (measured in Kroner, fixed prices), reflecting the continued replacement of relatively small and old ships by larger and more competitive units, for which construction prices and operating costs are lower per ton. Measured in tons, the merchant fleet is expected to expand even faster in 1970-1973 than in the preceding programme period; the recent flow of orders placed by Norwegian shipowners, which fluctuate strongly, points to a somewhat more buoyant investment picture than forecast.

The labour market is likely to remain tight. According to population trends, the natural increment to the labour force may fall from 7 800 persons per year earlier in the 1960's to 4 400 (0.3 per cent) per year in 1968-1973, mostly affecting women. However, assuming that a tight labour market would stimulate to higher participation rates and part-time work, particularly of married women, students and pensioners, the number of man-years worked may increase by 0.7 per cent a year, as in the 1960's. A further reduction of working hours per man, reduced from 2 300/2 400 a year in 1950 to 2 000 in 1969, is not excluded, but in the programme period a lowering of the retirement age is more likely. Employment is expected to fall by 16 per cent in primary industries, remain virtually unchanged in mining and manufacturing and grow fast in the service sectors.

With exports of goods and services amounting to two-fifths of GNP, external demand will be a major determinant of growth possibilities. Exports are forecast to continue to increase faster than output, but the difference between the two growth rates is expected to be much smaller than in the 1960's, reflecting two opposite trends. On the one hand, a growing number of branches in manufacturing industry will probably be producing for the world market. This is particularly true for the engineering industries, whose exports are likely to expand much faster than the "traditional" exports of pulp and paper products, fish and fish products, and base metals. On the other hand, production in some sectors, notably services not traded internationally (education, health, communications, dwellings), is expected to rise particularly fast, in conformity with trends of demand.

The Balance of Payments

Although output is expected to grow faster than domestic expenditure, the surplus on the current balance of payments is expected to disappear by 1973 because of a considerable deterioration in the terms of trade between

1968 and 1973 amounting to almost 4 per cent of GNP in the latter year. This is entirely due to the assumed decline in freight rates from the exceptionally high 1968/69 level. Moreover, there may be a secular fall in shipping earnings per ton as a result of the structural change in the merchant fleet in favour

of bigger units. In fact, total freight earnings are expected to be lower in 1973 than they were in 1968, despite an increase in the tonnage of 25 per cent. For goods, terms of trade may improve somewhat.

With the current account in approximate balance, and with foreign exchange reserves at a fairly comfortable level, the authorities do not envisage further long-term borrowing abroad of any considerable size.

Policies

Apart from the introduction of a TVA tax, which implies some change of emphasis from direct to indirect taxation (see Chapter II), no major tax reforms are envisaged in the coming four years. However, the government intends to put forward a proposal on a wage-tax system, which would dispense with the income tax declaration and simplify considerably tax collection.

The rate of increase of the volume of public expenditure on goods and services is expected to be similar to that of GNP; however, including a large share of wages which usually rise faster than the general price level, the value of expenditure may rise faster than GNP in current prices.

A major problem foreseen in the long-term programme is the expected rapid growth of the need for long-term funds, reflecting notably the forecast increase in business fixed investment and the government's growing borrowing requirements. Between 1968 and 1973 industrial fixed investment, estimated to increase by more than one-third, is expected to account foı one-quarter of the total rise in fixed investment (excluding ships) of Kr. 6 000 million. Almost an equal amount is accounted for by the rise in residential construction, the major part of which is financed by government lending through the State Housing Bank. Moreover, it is the intention of the authorities to reduce business borrowing abroad (excluding shipping), which in recent years has amounted to some Kr. 700 million annually. Assuming an unchanged degree of business self-financing, total private borrowing requirements (including municipalities) from all sources are estimated to increase by 50 per cent from 1968 to 1973 (from 6.6 to 10 billion Kroner). Within this total, borrowing from State banks (mainly the State Housing Bank) may double over the period, illustrating the growth of the government's borrowing needs to supply State banks with the necessary funds. Credit supply over the capital market (including also government issues) is envisaged to play a more dominant role (see Table 20).

A larger share of total savings, in 1973 estimated to about two-fifths, is expected to take the form of a current surplus on the central government's budget and an accumulation of funds by the National Insurance Scheme, the

latter becoming an important investor in long-term bonds. But private credit institutions may have to become much more important buyers of bonds if the need for long-term finance is to be met. Moreover, the Central Bank would also seem likely to increase its holdings of bonds, in order to supply the credit market with the estimated need for liquidity.

IV CONCLUSIONS

The easing of demand pressures and the slowdown of the growth of output in 1968 were primarily a result of the weakening of industrial investment and to some extent by the lower output in the fisheries. Because of the reduction in working hours productive capacity expanded less fast than earlier, and the adverse effects of the weakening of domestic demand on employment was therefore modest. Unemployment remained low by international standards. The decline in industrial investment was partly related to the termination of certain large projects, but as it developed it affected most industrial branches. Nevertheless, the level of investment in industry remained relatively high and the period of weaker investment demand seems already to have come to an end. Against this background, and given the easing of demand pressures associated with it, the levelling-off of investment activity should not give rise to concern.

With the indications of a strengthening of demand in recent months—particularly for exports and fixed investment—and with the expectation of anticipatory purchases of consumer durables before the introduction of the tax reform, there could be some risk of overheating towards the end of the year. The recent measures taken to restrict demand therefore seem appropriate. It cannot be excluded that further steps will be needed, and it is therefore important that policy should remain flexible.

A new and favourable feature in 1968 was the strong swing from deficit to surplus on the current external account, which seems likely to improve further this year. The improvement was mainly caused by developments in the shipping industry, which benefited from higher freight rates and at the same time reduced its net imports of ships significantly. The increase in the external surplus which is expected for 1969 will be more than accounted for by a further reduction in imports of ships. The trade balance (excluding ships) also improved in 1968, reflecting mainly a sharp increase in exports of base metals—due to the expansion of productive capacity and improved market conditions—and by a weakening in imports of investment goods. Thus, the improvement of the current account may to a large extent be temporary. Given the rapid growth of the world merchant fleet, freight rates are on a declining trend after the rise related to the Middle East crisis, and Norwegian imports of ships can be expected to increase strongly again in 1970 and later years. Exports of basic metals would seem unlikely to increase at the high rate experienced recently; the strongest rise in world trade in coming years may be in finished rather than semifinished manufactures. The surpluses of 1968 and 1969 do therefore not indicate a fundamental change in the external position of Norway.

During the 1960's, economic activity has expanded at a satisfactory rate, and the government's programme for 1970-1973 seeks to prolong this trend, aiming at an annual growth of GDP of 4.5 per cent. Moreover, the programme is aiming at only a moderate deficit on the current external account. This would seem to be a reasonable objective, given both the stage of economic development which now has been reached, the need for some other European countries to strengthen their foreign exchange reserves, and the difficulties in raising long-term capital abroad at reasonable terms. But the realisation of the programme will inter alia depend on a strong rise in Norwegian exports. And the achievement of a better foreign balance than in most of the 1960's will entail an increase in the national savings ratio and a switch of resources from domestic use to net exports. This is likely to require policies which will stimulate savings. Moreover, the realisation of the balance of payments objective may require some improvement of the cost performance of Norwegian industry. During the last 3 years, unit labour costs in manufacturing have developed unfavourably in relation to competing European countries, partly due to devaluations. Nevertheless, the Norwegian export performance has been relatively good, partly because of the strong export increase from capital-intensive industries (notably of base metals) which may not continue at such a high rate in the years to come. As already mentioned, the growth of international trade may be particularly strong in more highly processed goods and it is an objective of the authorities' policies to encourage the expansion of production and exports of such indus-

tries. An improvement of the cost performance may be necessary to this and the balance of payments target.

The long-term programme indicates that the supply of domestic long-term savings may have to be significantly increased in the next few years, partly because of the authorities' intention of reducing imports of long-term capital. The increased need for long-term funds may partly be covered by larger public savings in social insurance and over the budget, but there may also be need for transforming a larger proportion of private short-term savings into long-term capital. An effective use of available credit policy instruments is impoıtant in solving these problems.

PERSPECTIVES ÉCONOMIQUES DE L'OCDE

En juillet et décembre les PERSPECTIVES ÉCONOMIQUES DE L'OCDE donnent un aperçu général de l'évolution économique la plus récente dans l'ensemble de la zone OCDE et, au moyen d'une série de prévisions quantitatives intégrées, évaluent les perspectives. En supplément, cette publication contient fréquemment des études spéciales destinées à faciliter l'interprétation des tendances économiques.

Pour le prix de cette publication et une sélection d'autres ouvrages, voir au verso.
